**1. Cross-Reference to Related Applications**

[01] This application is based on and claims priority to U.S. Provisional Application Serial Number 60/429,151, filed November 26, 2002, the entire contents of which is herein incorporated by reference.

**2. Statement of Government Support**

5 [02] The subject invention was made with government support under a research project supported by NIH Grant #1 R43 HL074529-01. The United States government has certain rights in this invention.

**3. Field of the Invention**

[03] The present invention relates to the field of natriuretic compound conjugates and variant natriuretic compounds, and uses of these in the treatment of congestive heart disease and conditions related to this  
10 condition. For example, the compositions of the present invention provide a pharmacologically active natriuretic agent and prodrug that may be used in a formulation suitable for oral, nasal, intravenous, or subcutaneous administration. The invention also provides methods of preparing the natriuretic compound conjugates, compounds, and formulations containing them, as well as methods of using these conjugates and compounds. By way of example, the natriuretic compound conjugates comprise a natriuretic peptide  
15 including an NPR-A binding motif, at least one modifying moiety conjugation site, and also include at least one modifying moiety attached to the modifying moiety conjugation site. In some embodiments, the compound conjugates have retained pharmacological activity of the native natriuretic peptide, and have enhanced characteristics, such as improved bioavailability, enhanced resistance to proteolytic activity, and/or prolonged activity in the blood stream. In other embodiments, the compound conjugates are provided as  
20 hydrolysable prodrugs, which may have reduced pharmacological activity in the prodrug form relative to the native natriuretic peptide, and upon hydrolysis of the prodrug *in vivo*, an active natriuretic compound is released.

[04] The present invention is also related to the field of recombinant peptides and proteins, as well as methods for preparing these recombinant peptides and proteins. In particular, analogs of natriuretic peptides  
25 and proteins are disclosed herein. The analog natriuretic compounds of the invention may be described in some embodiments as having an amino acid sequence that has at least one substituted amino acid relative to the native sequence of the corresponding natriuretic peptide. In some embodiments, the analog natriuretic compounds of the invention may be described as having a pharmacological activity of native forms of brain-type natriuretic peptides (BNP), especially human BNP (hBNP), urodilatin, canine brain natriuretic peptide (cBNP), atrial natriuretic peptide (ANP), especially human ANP (hANP), dendroaspis natriuretic peptide  
30 (DNP), or C-type natriuretic peptide (CNP), particularly human CNP (hCNP).

#### 4. Background of the Invention

[05] Cardiovascular diseases constitute the leading cause of death in the United States regardless of gender or ethnicity. Of these diseases, congestive heart failure (CHF) is the only one that is increasing in prevalence (Massie and Shah 1997; Packer and Cohn 1999). According to the American Heart Association, the number of hospital discharges and the number of deaths due to CHF both rose roughly 2.5-fold from 1979 to 1999. Currently, about 5 million Americans have been diagnosed with CHF, and about 550,000 new cases occur annually (American Heart Association 2001). This life-threatening condition is accompanied by great financial impact. In fact, it is the single largest Medicare expense (Kayser 2002). Direct and indirect costs for treating CHF have been estimated as high as \$56 billion (Hussar 2002). Hospital expenses for the treatment of HF are more than double those for all forms of cancer combined (O'Connell and Bristow 1994).

[06] CHF is a common cause of death, is accompanied by high indirect costs for treatment, and has a high mortality rate. Once a patient has been diagnosed with CHF, the one-year mortality rate is about 20% (American Heart Association 2001). The probability for readmission for the same condition is very high, and several studies of readmission have recently been performed (Chin and Goldman 1997; Krumholz, Parent et al. 1997; Krumholz, Chen et al. 2000). Readmission rates in excess of 35% within one year of diagnosis are typical (Tsuchihashi, Tsutsui et al. 2001). Such frequent recurrence results in multiple emergency care visits and inpatient hospitalizations (Krumholz, Parent et al. 1997). Multiple hospitalizations and inadequate therapeutics define the current situation faced by those who suffer from CHF.

[07] A recent randomized study indicated that home-based intervention can potentially decrease the rate of readmission, prolong survival, and improve the quality of life for patients with CHF (Stewart, Marley et al. 1999). In an independent study that looked at socioeconomic factors, Tsuchihashi, et. al. concluded that both outpatient and home-based care are needed in order to reduce the mortality rate and lower the overall costs associated with CHF (Tsuchihashi, Tsutsui et al. 2001). Clearly, new therapies with broad application that can be used on an outpatient basis are desperately needed in this growing market.

[08] Brain type natriuretic peptide (BNP) is one of a family of peptides that are involved in cardiovascular, renal, and endocrine homeostasis. It was discovered in 1988 (Sudoh, Kangawa et al. 1988), almost a decade after the discovery of atrial natriuretic peptide (ANP). Although it was first isolated from porcine brain, it is known for its activity at receptors in vascular smooth muscle and endothelial cells. BNP is an endogenous peptide produced by the heart. It is first produced as prepro-BNP and is subsequently shortened twice to the active form, a 32-amino acid peptide with one disulfide bond.

[09] As illustrated in Figure 1, BNP binds to the natriuretic peptide receptor A (NPR-A), a membrane bound protein on the cell surface. The binding event triggers the synthesis of cGMP in the cytosol by

guanylate cyclase. It is through this secondary messenger that BNP accomplishes the cardio-vascular, renal, and endocrine effects with which it is associated. Regulation of BNP is accomplished by several different means. BNP molecules that bind to NPR-A and stimulate cGMP production are removed from circulation, but there are other means by which BNP is eliminated without invoking a response. The most common means of removal is through binding to the clearance receptor, natriuretic peptide receptor C (NPR-C). Upon binding to NPR-C, the peptide is taken into the cell and cleaved enzymatically. The next major means of clearance is degradation by neutral endopeptidase (NEP), which is a membrane-bound enzyme on the cell surface. Finally, BNP is removed to a small extent by renal filtration.

[10] Under normal conditions, BNP is produced in low amounts in the atria and ventricles. However, when the ventricles are stretched during cardiac decompensation, the amount of BNP that is produced increases greatly. Although the atria are still involved, the ventricles become the main site of production. The heart produces BNP in response to a stretching of the ventricles that occurs during decompensation at the outset of CHF. The effects of BNP include natriuresis, diuresis, vasodilation, and a lowering of diastolic blood pressure. These effects are brought about through the actions of a secondary messenger, cyclic guanosine monophosphate (cGMP). Production of cGMP is triggered when BNP interacts with the natriuretic peptide receptor A (NPR-A) which is a membrane-bound receptor located on the surface of endothelial cells in blood vessels, kidneys, and lungs. Plasma concentration of BNP incrementally increases with increased severity of CHF. Despite this increase, the beneficial effects of BNP are blunted in severe CHF, raising the possibility of a relative deficiency state in overt CHF. Alternatively, as the assays currently employed to measure plasma concentration of BNP do not specifically differentiate between pre-pro BNP and the mature form, this pro-hormone may not be adequately processed to its mature form in overt CHF. Therefore, either the amount of BNP that the heart can produce is overcome or prepro-BNP is not adequately converted into its active form, thus reducing its beneficial actions. Because of its early production at the onset of heart disease, BNP has become important as a diagnostic marker to detect patients who are at high risk of developing CHF (Yamamoto, Burnett et al. 1996; McDonagh, Robb et al. 1998; Richards, Nicholls et al. 1998; Nagaya, Nishikimi et al. 2000; Kawai, Hata et al. 2001; Maisel, Krishnaswamy et al. 2002; McNairy, Gardetto et al. 2002).

[11] BNP functions to relieve cardiac decompensation in several ways. As the name implies, BNP leads to the excretion of sodium and an increase in urine output, which lessen congestion. It also functions as a vasodilator, the effects of which are enhanced by several other actions. Most notable of these functions are the roles BNP plays in the interference of the renin-angiotensin-aldosterone system (RAAS). It leads to inhibition of renin, which is a key enzyme in the generation of the vasoconstrictive peptide angiotensin. It inhibits the overgrowth of epithelial cells lining vascular tissue, which left unchecked, can greatly reduce blood flow. A final way that BNP functions to relieve cardiac decompensation is its lusitropic effects. It improves myocardial relaxation of the ventricles, resulting in lower diastolic blood pressure.

[12] Practical limitations exist in using peptides as drugs. Proteolysis, both in the gut and in the bloodstream, is a major barrier to using peptides as therapeutics. Another difficulty encountered with non-endogenous peptides is immunogenicity. As a result of these problems, the approach of the pharmaceutical industry has been to create small, non-peptide molecules using medicinal chemistry. While this approach has met with success, it is costly, time consuming, and fraught with uncertainty in terms of pharmacokinetics and toxicity. Furthermore, identification of small organic molecules with agonist activity at peptide receptors has proved exceptionally challenging.

[13] While the use of "PEGylated" proteins is well established to date, they have been confined to injectable use. The present invention provides orally available conjugates of polypeptides, such as human brain-type natriuretic peptide (hBNP). Specifically, the present invention provides conjugates comprising PEG linked to therapeutic peptides and proteins in a formulation in the treatment of congestive heart failure. These preparations then function to protect the hBNP against proteolytic enzymes, and thereby permit the effective use of this agent as an agonist of human natriuretic peptide receptor A. As a result of this agonistic activity, there is enhanced production of cGMP.

[14] In August 2001, hBNP (native peptide) was approved by the FDA under the trade name Natrecor® (Nesiritide) for the treatment of acute congestive heart failure. Natrecor® was the first drug approved for the treatment of CHF in over twelve years. It is administered by intravenous continuous infusion over a period of 48 hours. As the drug is expensive and requires hospitalization, Natrecor® is only used for the most acute cases. Despite this expense and inconvenience, Natrecor® may be considered less expensive than some other therapies by reducing the amount of time patients spend in intensive care units.

[15] Currently, almost 5 million Americans have CHF and over 550,000 new cases are reported each year (American Heart Association 2001). Currently, direct costs for the treatment of CHF are well over \$20 billion (American Heart Association 2001). With diagnostic procedures now available to detect the onset of heart failure before cardiac damage occurs, there is great need for a drug with expanded utility that can be used in an outpatient or home-based setting.

## 5. Summary of the Invention

[16] The present invention broadly comprises variant and modified forms of several naturally occurring natriuretic peptides, proteins, analogs, and chemical conjugates of these natriuretic peptides, that possess one or more advantages over their naturally occurring counterparts. By way of example, some of these advantages include an increased resistance to proteolytic degradation, an improved time of persistence in the bloodstream, and/or an improved ability to traverse cell membrane barriers.

[17] Natriuretic compound conjugates according to some embodiments of the present invention comprise a natriuretic compound that includes a natriuretic protein receptor A binding motif (an NPR-A), at least one

modifying moiety conjugation site, and at least one modifying moiety attached to said modifying moiety conjugation site. By virtue of the modifying moiety attached to said natriuretic compound as part of the conjugate, the natriuretic compound conjugate can have modified hydrophilic characteristics relative to the native natriuretic compound that does not include a modifying moiety as described herein. By way of example and not limitation, and as described more fully herein, the modifying moiety may take the form of an oligomer of any variety of sizes, shapes, substitutions, and configurations.

[18] In some cases, the natriuretic compound conjugate is characterized at least in part by its increased resistance to enzymatic degradation, such as proteolysis, relative to a corresponding unconjugated form of the native natriuretic compound. These compound conjugates may be even further characterized by a retained therapeutically significant percentage of biological activity, such as cGMP stimulating activity, relative to the corresponding unconjugated natriuretic compound. The retained cGMP stimulating activity may be further described as at least 30%, 40%, 50%, 60%, 70%, 90%, 95%, or even up to 99% the cGMP activity of an unconjugated form of the natriuretic peptide as measured *in vitro*. Other examples of improved characteristics of the natriuretic compound conjugates of the invention having a modifying moiety, relative to unmodified (unconjugated) natriuretic compound, include improved ability of the natriuretic compound to pass through the GI tract and enter the blood stream; improved hydrophilicity, hydrophobicity, or amphiphilicity of the natriuretic compound; improved solubility of the natriuretic compound in aqueous environments or organic solvents; improved ability of the natriuretic compound to cross cell membranes; improved ability of the natriuretic compound to traverse the blood-brain barrier; improved ability of the natriuretic compound to target a certain receptor, cell, tissue, or organ; and improved pharmacokinetic profile of the natriuretic compound. In a preferred embodiment, the degradation of the biologically active agent component of the natriuretic compound is less than the degradation of unmodified (unconjugated) biologically active natriuretic compound, at a pH of about 2 for less than about 2 hours. The natriuretic compound component of the natriuretic compound can, for example, be more stable as a component of the natriuretic compound conjugates than the unconjugated natriuretic compound in the presence of plasma, proteases, liver homogenate, acidic conditions and/or basic conditions.

[19] Natriuretic peptide conjugates of the invention may induce the anti-hypertensive, cardiovascular, renal, and/or endocrine effects that are associated with the native peptide. In some embodiments, the modification of the natriuretic peptide will protect the peptide, such as hBNP, from proteolysis and facilitate delivery into the systemic circulation through the gut wall, resulting in natriuresis, diuresis, and/or vasodilation. Natriuretic peptide conjugates of the invention can therefore be effectively delivered as an oral formulation (instead of by continuous intravenous infusion for days in a hospital setting). This advantage is expected to reduce hospital costs associated with other CHF therapies by enabling self administration, which has not heretofore been possible, and is expected to expand the therapeutic use of natriuretic peptide, especially hBNP, to include early stage (e.g., class 1) and chronic CHF as well as acute CHF. A preferred

embodiment of the present invention is a non-immunogenic peptide conjugate that has increased resistance to degradative enzymes and is suitable for oral delivery and transport across the intestinal epithelium.

[20] The invention also provides several methods for the preparation of the natriuretic compound conjugates. These modifying moieties, can for example, take the form of linear and branched PEG or other  
5 polymeric structure.

## 6. Definitions

[21] Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which the invention belongs. The terminology used in the description of the invention herein is for the purpose of describing particular embodiments only  
10 and is not intended to be limiting of the invention. Headers are used for the convenience of the reader and are also not intended to be limiting of the invention. All publications, patent applications, patents, and other references mentioned herein are incorporated herein by reference in their entirety, as are the package inserts of any branded drugs referred to herein by their brand names.

[22] Singular forms “a”, “an”, and “the”, are intended to include the plural forms as well, unless the  
15 context clearly indicates otherwise.

[23] As used in the specification and the claims set forth herein, the following terms have the meanings indicated:

[24] “Amino acid” is defined herein as any naturally occurring, artificial, or synthetic amino acid in either its L or D stereoisomeric forms, unless otherwise specified. The term “residue” is used  
20 interchangeably with the term “amino acid”, and is often designated as having a particular position in a given sequence of amino acids.

[25] All amino acid abbreviations used in this disclosure are those accepted by the United States Patent and Trademark Office as set forth in 37 C.F.R. § 1.822(b). The following one-letter amino acid designations are used in the description of the present invention. Xaa is used to designate an unknown or undesignated  
25 amino acid. The integers above specific residues of the structure provided herein define the residue position number. This residue number is used in conjunction with the one letter amino acid nomenclature, described below, to designate the residue at which a substitution is made in the natriuretic peptide analogs of, for example, hBNP and ANP.

[26] Thus for example, when a mutant hBNP is synthesized in which arginine (R) replaces lysine (K) at  
30 residue position number 3 of wild-type hBNP, the nomenclature “BNPK3R” or “hBNP(1-32)K3R” is used. Multiple substitutions are designated in the same manner with a comma separating each substitution as exemplified below.

[27] The term “hBNP(1-32)K3R, K14R, K27R” designates a triple mutant hBNP having that hBNP sequence defined above with the substitution of arginine for lysine at residue position 3 (i.e. K3R), the substitution of arginine for lysine at residue position 14 (i.e. K14R), and the substitution of arginine for lysine at position 27 (i.e. K27R). Other mutants are defined in an analogous manner.

5 [28] The term “hBNP(1-32)K3R, K14R” designates a double mutant having the lysine replaced with arginine at residue 3 and 14 of hBNP.

	A=ala= alanine	L=leu= leucine	nle= Norleucine
	R=arg= arginine	K=lys= lysine	cha= cyclohexylalanine
	N=asn= asparagine	M=met= methionine	A*=har= hemoarginine
10	D=asp= aspartic acid	F=phe= phenylalanine	orn = ornithine
	C=cys= cysteine	P=pro= proline	pen = penicillamine
	Q=gln= glutamine	S=ser= serine	phg = phenyl glycine
	E=glu= glutamic acid	T=thr= threonine	mpa = mercaptopropionic acid
	G=gly= glycine	W=trp= tryptophan	a =ala* =D alanine
15	H=hrs= histidine	Y=tyr= tyrosine	C*= hemocysteine
	I=ile= isoleucine	V=val=valine	

[29] “Amphiphilic” means the ability to dissolve in both water and lipids, and the terms “amphiphilic moiety” and “amphiphile” means a moiety which is amphiphilic and/or which, when attached to a polypeptide or non-polypeptide drug, increases the amphiphilicity of the resulting conjugate, e.g., PEG-fatty acid oligomer, sugar fatty acid oligomer.

[30] “Biologically active” refers to an agent having therapeutic or pharmacologic activity, such as an agonist, partial agonist or antagonist.

25 [31] “Effective amount” as provided herein refers to a nontoxic but sufficient amount to provide the desired therapeutic effect. As will be pointed out below, the exact amount required will vary from subject to subject, depending on age, general condition of the subject, the severity of the condition being treated, the particular biologically active agent administered, and the like. An appropriate “effective” amount in any individual case may be determined by one of ordinary skill in the art by reference to the pertinent texts and literature and/or by using routine experimentation.

30 [32] “Hydrolyzable” refers to molecular bonds which are hydrolyzed under physiological conditions.

[33] "Hydrophilic" means the ability to dissolve in water, and the term "hydrophilic moiety" or "hydrophile" refers to a moiety which is hydrophilic and/or which when attached to another chemical entity, increases the hydrophilicity of such chemical entity. Examples include, but are not limited to, sugars and polyalkylene moieties such as polyethylene glycol.

5 [34] "Lipophilic" means having an affinity for fat, such as chemicals that accumulate in fat and fatty tissues, the ability to dissolve in lipids and/or the ability to penetrate, interact with and/or traverse biological membranes, and the term, "lipophilic moiety" or "lipophile" means a moiety which is lipophilic and/or which, when attached to another chemical entity, increases the lipophilicity of such chemical entity.

10 [35] "Lower alkyl" refers to substituted or unsubstituted alkyl moieties having from 1 to 6 carbon atoms.

[36] "Monodispersed" refers to a mixture of compounds wherein about 100 percent of the compounds in the mixture have the same molecular weight.

15 [37] "Pharmaceutically acceptable" with respect to a component, such as a salt, carrier, excipient or diluent of a composition according to the present invention is a component that is compatible with the other ingredients of the composition, in that it can be combined with the natriuretic compound conjugates of the present invention without eliminating the biological activity of the biologically active agent and is suitable for use with subjects as provided herein without undue adverse side effects (such as toxicity, irritation, and allergic response). Side effects are "undue" when their risk outweighs the benefit provided by the pharmaceutical composition. Examples of pharmaceutically acceptable components include, without  
20 limitation, any of the standard pharmaceutical carriers such as phosphate buffered saline solutions, water, emulsions such as oil/water emulsion, microemulsions and various types of wetting agents.

[38] "Polyalkylene glycol" refers to straight or branched polyalkylene glycol polymers such as polyethylene glycol, polypropylene glycol, and polybutylene glycol, and includes the monoalkylether of the polyalkylene glycol. In a particular embodiment, the polyalkylene glycol is polyethylene glycol or "PEG."  
25 The term "PEG subunit" refers to a single polyethylene glycol unit, i.e.,  $-(CH_2CH_2O)-$ .

[39] "Prodrug" refers to a biologically active agent that has been chemically derivitized such that, upon administration to a subject, the prodrug is metabolized to yield the biologically active agent.

30 [40] "Treat" or "treating" as used herein refers to any type of treatment that imparts a benefit to a subject afflicted with a disease or illness, including improvement in the condition of the subject (e.g., in one or more symptoms), delay in the progression of the condition, prevention or delay of the onset of the disease or illness, enhancement of normal physiological functionality, etc.

## 7. Brief Description of the Drawings

[41] Figure 1 – illustrates the mode of action and the regulation of BNP.

[42] Figure 2 - A representative scheme for oligomer activation and conjugation following a three-tiered conjugation strategy. Class 1 modifying moieties are non-hydrolysable, Class 2 modifying moieties are micropegylated, and Class 3 modifying moieties are fully hydrolysable.

## 8. Detailed Description of the Invention

[46] Natriuretic compound conjugates according to some embodiments of the present invention comprise a natriuretic compound that includes a natriuretic peptide receptor A binding motif (NPR-A), at least one modifying moiety conjugation site, and at least one modifying moiety attached to said modifying moiety conjugation site. By virtue of the modifying moiety attached to said natriuretic compound as part of the conjugate, the natriuretic compound conjugate can have modified hydrophilic characteristics related to the native natriuretic compound that does not include a modifying moiety as described herein. By way of example and not limitation, and as described more fully herein, the modifying moiety may take the form of an oligomer of any variety of sizes, shapes, substitutions, and configurations.

### 8.1 Natriuretic Compound

[47] The natriuretic compound conjugates of the invention include a natriuretic compound which includes a binding site for a natriuretic peptide receptor, such as NPR-A, as well as a conjugation site for coupling a modifying moiety thereto.

#### 8.1.1 Native Natriuretic Peptide

[48] The natriuretic compound may have the amino acid sequence of a native natriuretic peptide such as ANP, BNP, CNP or DNP, urodilatin, from any of a variety of species, such as humans, canines, and rats. Preferred native natriuretic peptides are human BNP, rat BNP, canine BNP, or hANP. Native sequences are also intended to include pro-natriuretic peptides and pre-pro peptides.

### 8.1.2 Natriuretic Compound Analogs

[49] The natriuretic compound may also be a biologically active analog of a native natriuretic peptide (a natriuretic analog). For example, a biologically active analog can be a native natriuretic compound with truncations, deletions, insertions, substitutions, replacements, side chain extensions, and fusion proteins, or combinations of the foregoing which do not eliminate the biological activity of the original compound. Preferably, the analog will include a native or artificial NPR-A binding motif and will retain some or all of the activity for binding NPR-A.

[50] Natriuretic polypeptide analogs can be obtained by various means. For example, certain amino acids can be substituted for other amino acids in the native natriuretic peptide structure without eliminating interactive binding capacity. In some cases, as have been described in the art, such modifications have resulted in increased affinity for NPR-A, relative to NPR-C, the clearance receptor, resulting in extended half life.

[51] Preferably, the analog will include a natriuretic molecule binding motif, such as an NPR-A binding motif.

[52] The natriuretic peptide may, for example, be defined by the sequence:

[53] CFGRXMDRISSSSGLGC (SEQ ID NO 2),

[54] wherein X is a compound, such as an amino acid residue, including a modifying moiety conjugation site. X in some embodiments comprises an amino acid to which a modifying moiety may attach. For example, X may comprise the amino acid Lys or Cys to which a modifying moiety may be attached. In another embodiment, X may be other than lysine; In these embodiments, the unconjugated peptide is also an aspect of the invention where X is arginine or and amino acid other than lysine to which a conjugation site may be created. An alternative structure for these embodiments is:

[55] CFGRX<sup>1</sup>MDRIX<sup>2</sup>GLGC,

[56] where X<sup>1</sup> is lysine, X<sup>2</sup> is one to four amino acids. X<sup>2</sup> may be S, SS, SSS, SSSS, K, KS, KSS, or KSSS. Where K is included as X<sup>2</sup> or part of the sequences of X<sup>2</sup>, a modifying moiety conjugation site.

[57] The natriuretic compound may, for example, have the structure:

[58] X<sup>1</sup>-CFGRX<sup>3</sup>MDRISSSSGLGC-X<sup>2</sup> (SEQ ID NO. \_\_)

[59] wherein at least one of X<sup>1</sup> and X<sup>2</sup> is present, X<sup>1</sup> is a peptide of from 1 to 10 amino acids, wherein X<sup>2</sup> is a peptide of from 1 to 6 amino acids, and wherein X<sup>3</sup> is other than lysine, such as arginine. For example, X<sup>1</sup> may include all or a C-terminal fragment of the 1-10 amino acid residue sequence from the N-terminus of

hBNP. In one embodiment, X<sup>1</sup> includes SPZ<sup>1</sup>MVQGSG- (SEQ ID NO: ), SPZ<sup>1</sup>MVQG, SPZ<sup>1</sup>MVQ, SPZ<sup>1</sup>MV, SPZ<sup>1</sup>M, SPZ<sup>1</sup>, PZ<sup>1</sup>MVQGSG, Z<sup>1</sup>MVQGSG, where Z<sup>1</sup> is lysine or arginine. Where Z<sup>1</sup> is lysine, a modifying moiety conjugation site is provided. In another embodiment, X<sup>2</sup> includes all or an N-terminal fragment of the 1-6 amino acid residue sequence from the C-terminus of hBNP. In one embodiment, X<sup>2</sup> is sequence Z<sup>2</sup>VLRRH (SEQ. ID. NO: ), Z<sup>2</sup>VLRR( ), Z<sup>2</sup>VLR( ), Z<sup>2</sup>VL, K, R, RVLRR( ), RVLRR( ), RVL, RV, or R, where Z<sup>2</sup> can be lysine or arginine. Where Z<sup>2</sup> is lysine, a modifying moiety conjugation site is provided. Where Z<sup>1</sup> is lysine, Z<sup>2</sup> may be other than lysine, and where Z<sup>2</sup> is lysine, Z<sup>1</sup> may be other than lysine. Alternatively, X<sup>1</sup> and X<sup>2</sup> may be any N-terminal and C-terminal tail amino acid sequence obtained from any natriuretic peptide. In some embodiments, an N-terminal and/or C-terminal tail sequence is present and is specifically not the N-terminal and C-terminal tails sequence of hBNP or any fragment thereof. It will be appreciated that the unconjugated natriuretic compound is also an aspect of the invention.

[60] In one embodiment, the natriuretic compound analog comprises an amino acid sequence:

[61] X<sup>1</sup>MVQSGGC<sup>1</sup>FGRX<sup>2</sup>MDRISSSSGLGC<sup>2</sup>X<sup>3</sup> (SEQ ID NO. ),

[62] wherein X<sup>1</sup>, X<sup>2</sup> and X<sup>3</sup> are each independently selected from the group consisting of Lys and amino acids other than Lys, and wherein at least one of X<sup>1</sup>, X<sup>2</sup> and X<sup>3</sup> is Lys and at least one of X<sup>1</sup>, X<sup>2</sup> and X<sup>3</sup> is an amino acid other than Lys; and

[63] C<sup>1</sup> and C<sup>2</sup> are cysteines and may be coupled by a disulfide bond. It will be appreciated that the unconjugated peptide analog is also an aspect of the invention.

[64] In one embodiment, at least one of X<sup>1</sup>, X<sup>2</sup> and X<sup>3</sup> is Arg. In another embodiment, X<sup>1</sup> is Lys, X<sup>2</sup> is Arg and X<sup>3</sup> is Arg. This embodiment may also include an amino acid sequence as described herein, N-terminal to X<sup>1</sup> and/or C-terminal to X<sup>3</sup>. For example, the N-terminal tail sequence, when present, may be S- or SP-, and the C-terminal tail, when present, may be -VLRRH, -VLRR, -VLR, -VL, or -V. In some embodiments, the N-terminal and/or C-terminal tail sequence is present and is specifically not N-terminal and C-terminal tail of hBNP or a fragment thereof.

[65] In another embodiment, the natriuretic peptide analog includes an amino acid sequence:

[66] CFGRX<sup>1</sup>MDRISSSSGLGCX<sup>2</sup> (SEQ ID NO: ),

[67] is wherein at least one of X<sup>1</sup> and X<sup>2</sup> is an amino acid comprising a modifying moiety conjugation site coupled to the modifying moiety and the other is any other amino acid or an unconjugated Lys. In one embodiment, X<sup>1</sup> is Lys coupled at its side chain to the modifying moiety and X<sup>2</sup> is another amino acid, for example Gly or Arg. Alternatively, X<sup>2</sup> is Lys coupled at its side chain to the modifying moiety and X<sup>1</sup> is another amino acid, for example Gly, Arg, or an amino acid other than lysine. In another embodiment, X<sup>1</sup> is Lys coupled at its side chain to the modifying moiety and X<sup>2</sup> is an unconjugated Lys. Alternatively, X<sup>2</sup> is

Lys coupled at its side chain to the modifying moiety and X<sup>1</sup> is an unconjugated Lys. It will be appreciated that the unconjugated peptide is also an aspect of the invention.

[68] Virtually any natriuretic peptide may be modified according to the present invention. By way of example peptide/proteins that are suitable candidates for modification are described in PCTUS0217567, which is specifically incorporated herein by reference. BNP, for example, includes Lys residues in the native sequence that preferably serve as the conjugation sites for the oligomer. In some embodiments of the present invention in which BNP is the native peptide, it may be desirable to remove any conjugation sites from the binding region of the peptide or to eliminate a binding site. Where it is desired that an oligomer not attach at a particular Lys residue of the peptide sequence, the Lys may be replaced with another amino acid, such as arginine. For example, conjugation with non-hydrolysable oligomers in this region can be detrimental to activity, though the applicants have surprisingly discovered that conjugation at Lys<sup>14</sup> results in a significant amount of retained activity. Thus, it may be desirable to replace such conjugation sites with amino acids that have similar chemical properties but are not readily conjugated. For example, in the hBNP sequence, the Lys<sup>14</sup> may be substituted with Arg, and thereby favor conjugation of the peptide at the Lys<sup>3</sup> of the peptide sequence for native BNP. Amino acid substitutions can be selected to replace Lys with an amino acid that is not readily conjugatable.

[69] In some cases, it may be desirable to add an additional site for conjugation. For example, in some embodiments, a positively charged amino acid residue is replaced with a Lys residue, for example, in the ANP peptide (native sequence), Arg<sup>27</sup> can be replaced with Lys.

[70] Mutations to add a conjugation site can be selected so that mutation and conjugation do not eliminate the activity of the resulting peptide conjugate, and in particular it's affinity for NPR-A. In one embodiment, the natriuretic compound is defined as the native hBNP amino acid sequence with one or more Lys residues are inserted within the hBNP sequence and/or added to an end of the hBNP sequence, and/or one or more native Lys residues deleted or replaced with conservative substitutions. Preferably such substitution or insertion is in one or more of the tail amino acid sequences of the natriuretic peptide.

[71] The conjugation site may in some embodiments be inserted, replaced or added at or near the N-terminal tail, e.g., an insertion or substitution within the N-terminal tail amino acid sequence, preferably at the N-terminus, or positioned 1, 2, 3, 4 or 5 amino acids from the N-terminus, or alternatively, positioned 1, 2, 3, 4, 5, 6, 7, 8, or 9 amino acids in an N-terminal direction from the N-terminal Cys that forms a part of the Cys bridge creating the loop. In a preferred embodiment, the natriuretic compound is defined as the native hBNP sequence with one or more mutations selected from the group consisting of Lys<sub>3</sub>→Arg, Lys<sub>14</sub>→Arg, Arg<sub>30</sub>→Lys, and Lys<sub>27</sub>→Arg, which one or more mutations do not eliminate the biological activity of the natriuretic peptide compound. Addition of more than one modifying moiety, such as an oligomer, may improve enzyme stability and/or enhance absorption.

[72] Many of the natriuretic peptide analogs will include the loop component of a native natriuretic peptide, such as Cys<sub>10</sub>-Cys<sub>26</sub> of hBNP in which Cys<sub>10</sub> and Cys<sub>26</sub> are coupled by a disulfide bond thereby forming a loop. In some cases, the loop may include substitutions, deletions, and/or insertions of amino acids differing from the native sequences, so long as such substitutions, deletions, and/or insertions do not eliminate the activity of the native sequences. Examples of such altered loop sequences can be found in Schoenfeld et al., "Mutations in B-type natriuretic peptide mediating receptor-A selectivity," FEBS Letters 414 (1997) 263-267, the entire disclosure of which is incorporated herein by reference, describes variants of BNP that preferentially bind natriuretic peptide receptor-A (NPR-A) compared to receptor-C (NPR-C). (U.S. Patent 6,525,022 and U.S. Patent 6,028,055). As an example, the natriuretic loop may include a native loop having one or more conservative substitutions which do not eliminate the natriuretic activity of the loop, e.g., in some cases that loop will have the sequence of the native loop (e.g., the native loop of hBNP) and have 1, 2, 3, 4, 5, 6, 7 or 8 conservative substitutions. In another embodiment the loop is shortened by removing a set of amino acids that does not eliminate biological activity. In one embodiment, the peptide analog includes the Cys<sub>10</sub>-Cys<sub>26</sub> loop of hBNP in which Lys<sub>14</sub> is replaced with Gly or Arg. In another embodiment, the SSSS component of the loop is altered or deleted.

[73] In addition, the natriuretic peptide loops or analogs of the native loops may include an N-terminal tail and/or a C-terminal tail, such as the tails of native natriuretic peptides, e.g., hBNP<sub>1-9</sub> and hBN(P<sub>27-32</sub>). The tails are single amino acids or peptides that do not eliminate biological activity. In some cases, the tails may include substitutions, deletions, and/or insertions of amino acids differing from the native sequences, so long as such substitutions, deletions, and/or insertions do not eliminate the beneficial activity of the native sequences. In one embodiment the tail or tails are based on native sequences, but truncated by one or more amino acids. For example, the N-terminal tail, when present, may be selected from the following hBNP segments 8-9, 7-9, 6-9, 5-9, 4-9, 3-9, 2-9, and 1-9; and any of the foregoing segments in which one or more Lys residues is replaced with a Gly or Arg residue. Similarly, a C-terminal tail, when present, may be selected from: hBNP segments 27-28, 27-29, 27-30, 27-31, and 27-32; and any of the foregoing hBNP segments wherein one or more Lys residues is replaced with a Gly or an Arg residue. Examples of preferred loop-plus-tail natriuretic peptides include hBNP segment 1-29; hBNP segment 1-26; and either of the foregoing hBNP segments in which one or more Lys residues are replaced with a Gly or an Arg.

[74] In addition to the foregoing analogs, a wide variety of analogs suitable for use in the invention have been described in the art. For example U.S. Patent 5,114,923, issued May 19, 1992, the entire disclosure of which is incorporated herein by reference, describes a peptide having natriuretic activity of the formula R<sup>1</sup>-Cys-Phe-Gly-Arg-Lys-Met-Asp-Arg-Ile-Ser-Ser-Ser-Ser-Gly-Leu-Gly-Cys-R<sup>2</sup> wherein R<sup>1</sup> is selected from (H); Gly-; Ser-Gly-; Gly-Ser-Gly-; Gln-Gly-Ser-Gly-; Val-Gln-Gly-Ser-Gly-; Met-Val-Gln-Gly-Ser-Gly-; Lys-Met-Val-Gln-Gly-Ser-Gly-; Pro-Lys-Met-Val-Gln-Gly-Ser-Gly-; Ser-Pro-Lys-Met-Val-Gln-Gly-Ser-Gly-; and R<sup>3</sup>-Ser-Pro-Lys-Met-Val-Gln-Gly-Ser-Gly- wherein R<sup>3</sup> is the 102 amino acid sequence of

positions 1-99 for the human protein or a C-terminal portion thereof, and R<sup>2</sup> is (OH), NH<sub>2</sub>, NHR' or wherein the modifying moiety' and the modifying moiety" are independently lower alkyl (1-4C) or R<sub>2</sub> is Lys; Lys-Val; Lys-Val-Leu; Lys-Val-Leu-Arg; Lys-Val-Leu-Arg-Arg; Lys-Val-Leu-Arg-Arg-His; or the amides (NH<sub>2</sub>, NHR' or NR' the modifying moiety") thereof.

5 [75] U.S. Patent, 4,904,763, issued February 2, 1990, the entire disclosure of which is incorporated herein by reference, also describes natriuretic peptide analogs suitable for use in the present invention, such as X-Cys Phe Gly Arg Lys Met Asp Arg Ile Ser Ser Ser Ser Gly Leu Gly Cys Lys Val Leu Arg Arg His-OH, wherein X is H, H-Gly-Ser-Gly-, or H-Ser-Pro-Lys-Met-Val-Gln-Gly-Ser-Gly.

10 [76] U.S. Patent 4,904,763, issued February 27, 1990 (the entire disclosure of which is incorporated herein by reference) describes other natriuretic peptide analogs suitable for use in the present invention, including X-Cys-Phe-Gly-Arg-Arg-Leu-Asp-Arg-Ile-Gly-Ser-Leu-Ser-Gly-Leu-Gly-Cys-Y (where the 2 cysteines are bridged by a disulfide bond) wherein X means H or H-Asp-Ser-Gly- and Y denotes -Asn-Val-Leu-Arg-Arg-Tyr-OH, -Asn-Val-Leu-Arg-Arg-OH, -Asn-Val-Leu-Arg-Tyr-OH, -Asn-Val-Leu-Arg-OH, -Asn-Val-Leu-OH or Asn-Ser-Phe-Arg-Tyr-OH, or a salt thereof. Another set of analogs suitable for use in  
15 PCT Publication No. WO8912069, published December 14, 1989.

[77] A further set of natriuretic peptide analogs suitable for use in the present invention is described in U.S. Patent Publication No. 20030109430, published on June 12, 2003, the entire disclosure of which is incorporated herein by reference. This publication describes a peptide having natriuretic activity of the formula: R<sup>1</sup>-Cys-Phe-Gly-Arg-Arg/Lys-Leu/Met-Asp-Arg-Ile-Lys-Met-Gly/Ser-Ser-Leu/Ser-Ser-Gly-Leu-  
20 Gly-Cys-R<sub>2</sub>, wherein R<sup>1</sup> is selected from the group consisting of: (H); Gly-; Ser-Gly-; Asp/Lys/Gly-Ser-Gly-; Arg/His/Gln-Asp/Lys/Gly-Ser-Gly-; Met/Val-Arg/His/Gln-Asp/Lys/Gly-Ser-Gly-; Thr/Met-Met/Val-Arg/His/Gln-Asp/Lys/Gly-Ser-Gly-; Lys-Thr/Met-Met/Val-Arg/His/Gln-Asp/Lys/Gly-Ser-Gly-; Pro-Lys-Thr/Met-Met/Val-Arg/His/Gln-Asp/Lys/Gly-Ser-Gly-; Ser-Pro-Lys-Thr/Met-Met/Val-Arg/His/Gln-Asp/Lys/Gly-Ser-Gly-; or a 10 to 109-amino acid sequence of the native upstream sequence for porcine,  
25 canine or human BNP, or a composite thereof; R<sup>2</sup> is (OH), NH<sub>2</sub>, or NR'R" wherein R' and R" are independently lower alkyl (in this case, 1-4 C) or is Asn/Lys; Asn/Lys-Val; Asn/Lys-Val-Leu; Asn/Lys-Val-Leu-Arg; Asn/Lys-Val-Leu-Arg-Arg/Lys; Asn/Lys-Val-Leu-Arg-Arg/Lys-Tyr/His; or the amides (NH<sub>2</sub> or NR'R") thereof, with the proviso that if the formula is R<sup>1</sup>-Cys-Phe-Gly-Arg-Arg-Leu-Asp-Arg-Ile-Gly-Ser-Leu-Ser-Gly-Leu-Gly-Cys-R<sup>2</sup>, and R<sup>1</sup> is Asp-Ser-Gly-, R<sup>2</sup> cannot be Asn-Val-Leu-Arg-Arg-Tyr.

30 [78] Still another set of analogs is described in Scios, European Patent EP0542863B1, issued November 26, 1997, which describes a fusion protein which comprises from N-terminal to C-terminal: a carrier protein of about 10 to about 50 kDa which does not contain Glu residues or Asp-Gly sequences as a Staph V8 cleavage site; a Staph V8 cleavage comprising a Glu residue or Asp-Gly sequence positioned at the C-terminal of said carrier; and ; and a peptide not containing a Staph V8 cleavage site fused to said cleavage

site; wherein said fusion protein exhibits a pI of about 8.0 or greater. The patent also describes the use of an N-terminal leader of 6 to 20 amino acids.

[79] Other natriuretic peptide analogs suitable for use in the present invention are described in Daiichi's U.S. Patent Publication No. 20020086843, published on July 4, 2002 (the entire disclosure of which is incorporated herein by reference), which describes a physiologically active polypeptide X-Cys-Phe-Gly-Arg-Lys-Met-Asp-Arg-Ile-Ser-Ser-Ser-Ser-Gly-Leu-Gly-Cys-Lys-Val-Leu-Arg-Arg-His-OH [where the 2 cysteines are bridged] wherein X is H, H-Gly-Ser-Gly-, or H-Ser-Pro-Lys-Met-Val-Gln-Gly-Ser-Gly-.

[80] In making such substitutions, the hydropathic index of amino acids can be considered. The importance of the hydropathic amino acid index in conferring interactive biologic function on a polypeptide is generally understood in the art. It is accepted that the relative hydropathic character of the amino acid contributes to the secondary structure of the resultant polypeptide, which in turn defines the interaction of the protein with other molecules. Each amino acid has been assigned a hydropathic index on the basis of its hydrophobicity and charge characteristics as follows: isoleucine (+4.5); valine (+4.2); leucine (+3.8); phenylalanine (+2.8); cysteine/cystine (+2.5); methionine (+1.9); alanine (+1.8); glycine (-0.4); threonine (-0.7); serine (-0.8); tryptophan (-0.9); tyrosine (-1.3); proline (-1.6); histidine (-3.2); glutamate (-3.5); glutamine (-3.5); aspartate (-3.5); asparagines (-3.5); Lys (-3.9); and Arg (-4.5). As will be understood by those skilled in the art, certain amino acids can be substituted by other amino acids having a similar hydropathic index or score and still result in a polypeptide with similar biological activity, *i.e.*, still obtain a biological functionally equivalent polypeptide. In making such changes, the substitution of amino acids whose hydropathic indices are within  $\pm 2$  of each other is preferred, those which are within  $\pm 1$  of each other are particularly preferred, and those within  $\pm 0.5$  of each other are even more particularly preferred.

[81] It is also understood in the art that the substitution of like amino acids can be made effectively on the basis of hydrophilicity. U.S. Patent 4,554,101, the disclosure of which is incorporated herein in its entirety, provides that the greatest local average hydrophilicity of a protein, as governed by the hydrophilicity of its adjacent amino acids, correlates with a biological property of the protein. As detailed in U.S. Patent 4,554,101, the following hydrophilicity values have been assigned to amino acid residues: Arg (+3.0); Lys ( $\pm 3.0$ ); aspartate ( $\pm 3.0 \pm 1$ ); glutamate ( $\pm 3.0 \pm 1$ ); serine (+0.3); asparagine (+0.2); glutamine (+0.2); glycine (0); threonine (-0.4); proline ( $-0.5 \pm 1$ ); alanine (-0.5); histidine (-0.5); cysteine (-1.0); methionine (-1.3); valine (-1.5); leucine (-1.8); isoleucine (-1.8); tyrosine (-2.3); phenylalanine (-2.5); tryptophan (-3.4). As is understood by those skilled in the art, an amino acid can be substituted for another having a similar hydrophilicity value and still obtain a biologically equivalent, and in particular, an immunologically equivalent polypeptide. In such changes, the substitution of amino acids whose hydrophilicity values are within  $\pm 2$  of each other is preferred, those which are within  $\pm 1$  of each other are particularly preferred, and those within  $\pm 0.5$  of each other are even more particularly preferred.

[82] As outlined above, amino acid substitutions/insertions can be based on the relative similarity of the amino acid side-chain substituents, for example, their hydrophobicity, hydrophilicity, charge, size, and the like. Exemplary substitutions (*i.e.*, amino acids that can be interchanged without significantly altering the biological activity of the polypeptide) that take various of the foregoing characteristics into consideration are well known to those skill in the art and include, for example Arg and Lys; glutamate and aspartate; serine and threonine; glutamine and asparagine; and valine, leucine and isoleucine.

[83] As will be understood by those skilled in the art, natriuretic peptide (e.g., BNP) analogs can be prepared by a variety of recognized peptide synthesis techniques including, but not limited to, classical (solution) methods, solid phase methods, semi-synthetic methods, and recombinant DNA methods.

### 8.1.3 Multi-BNP Peptide

[84] The natriuretic compound may also be a multi-peptide having two or more natriuretic compound units in sequence and optionally including spacer sequences between the natriuretic compound units. The compounds may also optionally comprising a leader and/or extension sequence at either or both ends of the natriuretic peptide compound. For example, by way of example and not limiting and without limiting the structure and/or formula of each multi-peptide may, have the following structures: NP-[NP]<sub>n</sub>; NP-[Spacer-NP]<sub>n</sub>; Leader-[Spacer-NP]<sub>n</sub>; Leader-[Spacer-NP]<sub>n</sub>-Extension, where

[92] where

[93] n may, for example be 1, 2, 3, 4, 5, 6, 7, 8, 9 or 10;

[94] NP is a natriuretic peptide or natriuretic peptide analog;

[95] Spacer may, for example, be an enzyme cleavage site preferably an enzyme degradation site that is not present in NP or a chemical cleavage site preferably that is not present in NP, and may block the N-terminus of the NP of the multi-peptide during chemical conjugation and improve solubility of the multi-peptide in cytoplasm or cell medium;

5 [96] Leader may for example be a single amino acid, an amino acid sequence, a peptide (e.g., leader peptide or signal peptide), or a protein; and Leader is selected to block the N-terminus from conjugation; assists in purification of the multi-peptide (e.g., (His)<sub>6</sub>-Ala-Asp-Gly-Glu – cleavable by enzyme cocktail: V8 protease (endoproteinase Glu-C) and endoproteinase (Asp-N)); improves solubility and/or assists in excretion from the cell; (e.g., Ala-Asp-Gly-Glu); and Leader is preferably  
10 cleavable from the multi-peptide by enzymatic or chemical cleavage;

[97] Extension may for example be a single amino acid, an amino acid sequence, a peptide (e.g., leader peptide or signal peptide), or a protein; and Extension is selected to block the C-terminus from conjugation, assist in purification of the multi-peptide (e.g., (His)<sub>6</sub>-Ala-Asp-Gly-Glu), improves solubility, and/or assists in excretion from the cell; (e.g., Ala-Asp-Gly-Glu – cleavable by  
15 enzyme cocktail: V8 protease (endoproteinase Glu-C) and endoproteinase (Asp-N)); and Extension is preferably cleavable from the multi-peptide by enzymatic or chemical cleavage.

[98] Leader may, for example, be a signal peptide for causing a cell to excrete the BNP or a pre-leader sequence or a pre-leader sequence before or after a fusion partner protein; and blocks the N-terminal of NP of the multi-peptide during chemical conjugation and/or assist solubility of the  
20 multi-peptide in cytoplasm or cell medium; and

[99] Extension may, for example, be a peptide that assists in purification of the multi-peptide or assist solubility of the multi-peptide in cytoplasm and cell medium.

[100] In one embodiment, Spacer is Arg-Arg-Asp-Ala-Glu-Asp-Pro-Arg, Leader is Glu-Gly-Asp-Arg-Arg, and Extension is (His)<sub>6</sub>-Glu-Gly-Asp-Arg-Arg. In this embodiment, the NP can be  
25 released using a trypsin and carboxypeptidase B enzyme cocktail.

[101] In one embodiment, Spacer is Arg-Arg-Asp-Ala-Glu-Asp-Arg-Arg, Leader is Glu-Gly-Asp-Arg-Arg, Extension is (His)<sub>6</sub>-AAA-Glu-Gly-Asp-Arg-Arg, where AAA is an amino acid sequence from 3 to 40 amino acid residue in length, preferably 3-15. In this embodiment, the NP can be released using a trypsin and carboxypeptidase B enzyme cocktail.

30 [102] In another embodiment, Spacer is Arg-Gly-Asp-Ala-Glu-Asp-Pro-Arg, Leader is Glu-Gly-Asp-Pro-Arg, and Extension is (His)<sub>6</sub>-Glu-Gly-Asp-Pro-Arg. In this embodiment, the NP can be released using a thrombin and Carboxypeptidase B enzyme cocktail.

[103] In another embodiment, Spacer is Ala-Arg-Gly-Asp-Ala-Glu-Asp-Pro-Arg, Leader is Glu-Gly-Asp-Pro-Arg, and Extension is (His)<sub>6</sub>-Glu-Gly-Asp-Pro-Arg. In this embodiment, the NP can be released using a thrombin and carboxypeptidase A enzyme cocktail.

5 [104] In another embodiment, Spacer is Met-Met, Leader is Met-Met, and extension is (His)<sub>6</sub>-AAA-Met-Met, where AAA is any amino acid sequence from 3 to 40 amino acid residues in length. In this embodiment, the NP can be released using CNBr.

[105] In another embodiment, Spacer is Asp-Asp-Ala-Gly-Glu, Leader is Ala-Asp-Gly-Glu, and Extension is (His)<sub>6</sub>-Ala-Asp-Gly-Glu. In this embodiment, the NP can be released using a V8 protease (endoproteinase Glu-C) and endoproteinase Asp-N cocktail.

10 [106] In another embodiment, Spacer is Glu-Ala-Gly-Glu, Leader is Ala-Asp-Gly-Glu, and Extension is (His)<sub>6</sub>-Ala-Asp-Gly-Glu. In this embodiment, the NP can be released using a V8 protease (endoproteinase Glu-C) to yield NP-Glu, a novel NP analog.

15 [107] In another embodiment, Spacer is Glu-Glu, Leader is Glu-Gly-Asp-Ala at the C-terminus and Extension is Glu-Gly-Asp-Ala(His)<sub>6</sub>-Glu. where the C-terminus is linked with a fusion partner, an appropriate fusion protein, which can, for example, be cleavable via enterokinase. In this embodiment, the NP can be released using a V8 protease (endoproteinase Glu-C) to yield NP-Glu, a novel NP analog.

20 [108] In another embodiment, Spacer is Glu-Glu, Leader is Ala-Asp-Gly-Glu and Extension is (His)<sub>6</sub>-Ala-Asp-Gly-Glu where the N-terminus is linked with a fusion partner, an appropriate fusion protein, which can, for example, be cleavable via enterokinase. In this embodiment, the NP can be released using a V8 protease (endoproteinase Glu-C) to yield NP-Glu, a novel NP analog.

25 [109] In another embodiment, Spacer is Glu-Glu, Leader is Glu-Gly-Asp-Ala at the C-terminal and the Extension is Glu-Gly-Asp-Ala-(His)<sub>6</sub>-Glu, and the C-terminus is linked with a fusion partner, an appropriate fusion protein. In this embodiment, the NP can be released using a V8 protease (endoproteinase Glu-C) to yield NP-Glu, a novel NP analog.

[110] In another embodiment, Spacer is Glu-Glu, Leader is Ala-Asp-Gly-Glu and Extension is Glu-(His)<sub>6</sub>-Ala-Asp-Gly-Glu where the N-terminus is linked with a fusion partner, an appropriate fusion protein. In this embodiment, the NP can be released using a V8 protease (endoproteinase Glu-C) to yield NP-Glu, a novel NP analog.

## 8.2 Modifying Moieties

[111] Modifying moieties are moieties that modify the natriuretic compound, such as a BNP peptide compound, and provide the compound with desired properties as described herein. For example, the modifying moiety can reduce the rate of degradation of the natriuretic compound in various environments (such as the GI tract, and/or the bloodstream), such that less of the natriuretic compound is degraded in the modified form than would be degraded in the absence of the modifying moiety in such environments. Preferred modifying moieties are those which permit the natriuretic compound conjugate to retain a therapeutically significant percentage of the biological activity of the parent natriuretic compound.

### 8.2.1 Moieties that Effect Stability, Solubility, and/or Biological Activity

[112] There are numerous moieties that can be attached to the natriuretic compound to form the natriuretic compound conjugates described herein that modify the stability, solubility, and/or biological activity of the parent natriuretic compound. Examples include hydrophilic polymers or oligomers, amphiphilic polymers or oligomers, and lipophilic polymers or oligomers.

[113] The polymers (or shorter chain oligomers) can include weak or degradable linkages in their backbones. For example, the polyalkylene glycols can include hydrolytically unstable linkages, such as lactide, glycolide, carbonate, ester, carbamate and the like, which are susceptible to hydrolysis. This allows the polymers to be cleaved into lower molecular weight fragments. Examples of such polymers are described, for example, in U.S. Patent No. 6,153,211 to Hubbell et al.

[114] Representative hydrophilic, amphiphilic, and lipophilic polymers and oligomers are described in more detail below.

### 8.2.2 Hydrophilic Moieties

[115] The hydrophilic moiety may be various hydrophilic moieties as will be understood by those skilled in the art including, but not limited to, polyalkylene glycol moieties, other hydrophilic polymers, sugar moieties, polysorbate moieties, and combinations thereof.

#### 8.2.2.1 Polyalkylene Glycol Moieties

[116] Polyalkylene glycols are compounds with repeat alkylene glycol units. In some embodiments, the units are all identical (e.g., polyethylene glycol or polypropylene glycol). In other embodiments, the alkylene units are different (e.g., polyethylene-co-propylene glycol, or PLURONICS®). The polymers can be random copolymers (for example, where ethylene oxide and propylene oxide are co-polymerized) or branched or graft copolymers.

[117] Polyethylene glycol, or PEG, is a preferred polyalkylene glycol, and is useful in biological applications because it has highly desirable properties and is generally regarded as safe (GRAS) by the Food

and Drug Administration. PEG has the formula  $-(CH_2CH_2O)_n-$ , where n can range from about 2 to about 4000 or more. PEG typically is colorless, odorless, water-soluble or water-miscible (depending on molecular weight), heat stable, chemically inert, hydrolytically stable, and generally nontoxic. PEG is also biocompatible, and typically does not produce an immune response in the body. Preferred PEG moieties of the invention include a number of PEG subunits selected from the following ranges shown in order of increasing preference: 2-50, 2-40, 2-30, 2-25, 2-20, 2-15, 2-10. In certain embodiments, the modifying moieties will include 2, 3, 4, 5, 6, 7, 8, 9, or 10 subunits.

[118] The PEG may be monodispersed (e.g., as previously described by the applicants in U.S. Patent Application Nos. 09/873,731 and 09/873,797, both filed June 4, 2001 the entire disclosures of which are incorporated herein by reference) or polydispersed as commonly supplied on the market. By monodispersed, it is meant that the polyalkylene glycol can have a single molecular weight, or a relatively narrow range of molecular weights. One advantage of using the relatively low molecular weight, monodispersed polymers is that they form easily defined conjugate molecules, which can facilitate both reproducible synthesis and FDA approval.

[119] The PEG can be a linear polymer with a hydroxyl group at each terminus (before being conjugated to the remainder of the natriuretic compound). The PEG can also be an alkoxy PEG, such as methoxy-PEG (or mPEG), where one terminus is a relatively inert alkoxy group, while the other terminus is a hydroxyl group (that is coupled to the natriuretic compound). The PEG can also be branched, which can in one embodiment be represented as  $R(-PEG-OH)_m$  in which R represents a central (typically polyhydric) core agent such as pentaerythritol or glycerol, and m represents the number of arms. Each branch can be different and can be terminated, for example, with ethers and/or esters. The number of arms m can range from three to a hundred or more, and one or more of the terminal hydroxyl groups can be coupled to the remainder of the natriuretic compound, or otherwise subject to chemical modification. Other branched PEG include those represented by the formula  $(CH_3O-PEG-)_pR-Z$ , where p equals 2 or 3, R represents a central core such as Lys or glycerol, and Z represents a group such as carboxyl that is subject to ready chemical activation. Still another branched form, the pendant PEG, has reactive groups, such as carboxyls, along the PEG backbone rather than, or in addition to, the end of the PEG chains. Forked PEG can be represented by the formula  $PEG(-LCHX_2)_n$  is another form of branched PEG, where L is a linking group and X is an activated terminal group. The term polyethylene glycol or PEG represents or includes all forms of linear or branched PEG, and polyalkylene glycol or PEG includes all forms of linear or branched PEG.

#### 8.2.2.2 Sugar Moieties

[120] The natriuretic compounds described herein can include sugar moieties, as such as known by those skilled in the art. In general, the sugar moiety is a carbohydrate product of at least one saccharose group. Representative sugar moieties include, but are not limited to, glycerol moieties, mono-, di-, tri-, and

oligosaccharides, and polysaccharides such as starches, glycogen, cellulose and polysaccharide gums. Specific monosaccharides include C<sub>6</sub> and above (preferably C<sub>6</sub> to C<sub>8</sub>) sugars such as glucose, fructose, mannose, galactose, ribose, and sedoheptulose; di- and trisaccharides include moieties having two or three monosaccharide units (preferably C<sub>5</sub> to C<sub>8</sub>) such as sucrose, cellobiose, maltose, lactose, and raffinose.

5 Conjugation using sugar moieties is described in US Patents 5,681,811, 5,438,040, and 5,359,030, the entire disclosures of which are incorporated herein by reference.

#### 8.2.2.3 Polysorbate Moieties

[121] The polysorbate moiety may be various polysorbate moieties as will be understood by those skilled in the art including, but are not limited to, sorbitan esters, and polysorbate derivatized with polyoxyethylene.

10 Conjugation using polysorbate moieties is described in US Patents 5,681,811, 5,438,040, and 5,359,030, the entire disclosures of which are incorporated herein by reference.

#### 8.2.2.4 Biocompatible Water-Soluble Polycationic Moieties

[122] In some embodiments, biocompatible water-soluble polycationic polymers can be used. Biocompatible water-soluble polycationic polymers include, for example, any polymer having protonated  
15 heterocycles attached as pendant groups. "Water soluble" means that the entire polymer is soluble in aqueous solutions, such as buffered saline or buffered saline with small amounts of added organic solvents as cosolvents, at a temperature between 20 and 37°C. In some embodiments, the polymer itself is not sufficiently soluble in aqueous solutions per se but is brought into solution by grafting with water-soluble polymers such as PEG chains. Examples include polyamines having amine groups on either the polymer  
20 backbone or the polymer sidechains, such as poly-L-Lys and other positively charged polyamino acids of natural or synthetic amino acids or mixtures of amino acids, including poly(D-Lys), poly(ornithine), poly(Arg), and poly(histidine), and nonpeptide polyamines such as poly(aminostyrene), poly(aminoacrylate), poly (N-methyl aminoacrylate), poly (N-ethylaminoacrylate), poly(N,N-dimethyl aminoacrylate), poly(N,N-diethylaminoacrylate), poly(aminomethacrylate), poly(N-methyl amino-  
25 methacrylate), poly(N-ethyl aminomethacrylate), poly(N,N-dimethyl aminomethacrylate), poly(N,N-diethyl aminomethacrylate), poly(ethyleneimine), polymers of quaternary amines, such as poly(N,N,N-trimethylaminoacrylate chloride), poly(methacrylamidopropyltrimethyl ammonium chloride), and natural or synthetic polysaccharides such as chitosan.

#### 8.2.2.5 Other Hydrophilic Moieties

30 [123] Other hydrophilic polymers can also be used. Examples include poly(oxyethylated polyols) such as poly(oxyethylated glycerol), poly(oxyethylated sorbitol), and poly(oxyethylated glucose); poly(vinyl alcohol) ("PVA"); dextran; carbohydrate-based polymers and the like. The polymers can be homopolymers or random or block copolymers and terpolymers based on the monomers of the above polymers, straight chain or branched.

[124] Specific examples of suitable additional polymers include, but are not limited to, poly(oxazoline), difunctional poly(acryloylmorpholine) ("PACM"), and poly(vinylpyrrolidone)("PVP"). PVP and poly(oxazoline) are well known polymers in the art and their preparation should be readily apparent to the skilled artisan. PACM and its synthesis and use are described in U.S. Patents 5,629,384 and 5,631,322, the disclosures of which are incorporated herein by reference in their entirety.

### 8.2.3 Bioadhesive Polyanionic Moieties

[125] Certain hydrophilic polymers appear to have potentially useful bioadhesive properties. Examples of such polymers are found, for example, in U.S. Patent No. 6,197,346 to Mathiowitz, et al. Those polymers containing carboxylic groups (e.g., poly(acrylic acid)) exhibit bioadhesive properties, and also are readily conjugated with the natriuretic compounds described herein. Rapidly bioerodible polymers that expose carboxylic acid groups on degradation, such as poly(lactide-co-glycolide), polyanhydrides, and polyorthoesters, are also bioadhesive polymers. These polymers can be used to deliver the natriuretic compounds to the gastrointestinal tract. As the polymers degrade, they can expose carboxylic acid groups to enable them to adhere strongly to the gastrointestinal tract, and can aid in the delivery of the natriuretic compound conjugates.

### 8.2.4 Lipophilic Moieties

[126] In some embodiments, the modifying moiety comprises a lipophilic moiety. The lipophilic moiety may be various lipophilic moieties as will be understood by those skilled in the art including, but not limited to, alkyl moieties, alkenyl moieties, alkynyl moieties, aryl moieties, arylalkyl moieties, alkylaryl moieties, fatty acid moieties, adamantantyl, and cholesteryl, as well as lipophilic polymers and/or oligomers.

[127] The alkyl moiety can be a saturated or unsaturated, linear, branched, or cyclic hydrocarbon chain. In some embodiments, the alkyl moiety has at least 1, 2, 3, or more carbon atoms. In other embodiments, the alkyl moiety is a linear, saturated or unsaturated alkyl moiety having between 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20 carbon atoms. Examples include saturated, linear alkyl moieties such as methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, nonyl, decyl, undecyl, dodecyl, tridecyl, tetradecyl, pentadecyl, hexadecyl, octadecyl, nonadecyl and eicosyl; saturated, branched alkyl moieties such as isopropyl, *sec*-butyl, *tert*-butyl, 2-methylbutyl, *tert*-pentyl, 2-methyl-pentyl, 3-methylpentyl, 2-ethylhexyl, 2-propylpentyl; and unsaturated alkyl moieties derived from the above saturated alkyl moieties including, but not limited to, vinyl, allyl, 1-butenyl, 2-butenyl, ethynyl, 1-propynyl, and 2-propynyl. In other embodiments, the alkyl moiety is a lower alkyl moiety. In still other embodiments, the alkyl moiety is a C<sub>1</sub> to C<sub>3</sub> lower alkyl moiety. In some embodiments, the modifying moiety specifically does not consist of an alkyl moiety, or specifically does not consist of a lower alkyl moiety, or specifically does not consist of an alkane moiety, or specifically does not consist of a lower alkane moiety.

[128] The alkyl groups can either be unsubstituted or substituted with one or more substituents, and such substituents preferably either do not interfere with the methods of synthesis of the conjugates or eliminate the biological activity of the conjugates. Potentially interfering functionality can be suitably blocked with a protecting group so as to render the functionality non-interfering. Each substituent may be optionally substituted with additional non-interfering substituents. The term “non-interfering” characterizes the substituents as not adversely affecting any reactions to be performed in accordance with the process of this invention.

The fatty acid moiety may be various fatty acid moieties including natural or synthetic, saturated or unsaturated, linear or branched fatty acid moieties. In some embodiments, the fatty acid moiety has at least 2, 3, 4, or more carbon atoms. In other embodiments, the fatty acid moiety has 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, or 24 carbon atoms.

[129] When the modifying moiety is an aryl ring, the ring can be functionalized with a nucleophilic functional group (such as OH, SH, or NHR') that is positioned so that it can react in an intramolecular fashion with the carbamate moiety and assist in its hydrolysis. In some embodiments, the nucleophilic group is protected with a protecting group capable of being hydrolyzed or otherwise degraded *in vivo*, with the result being that when the protecting group is deprotected, hydrolysis of the conjugate, and resultant release of the parent natriuretic compound, is facilitated.

#### 8.2.5 Amphiphilic Moieties

[130] In some embodiments, the modifying moiety includes an amphiphilic moiety. Many polymers and oligomers are amphiphilic. These are often block co-polymers, branched copolymers or graft co-polymers that include hydrophilic and lipophilic moieties, which can be in the form of oligomers and/or polymers, such as straight chain, branched, or graft polymers or co-polymers.

[131] The hydrophilic polymers or oligomers described may include combinations of any of the lipophilic and hydrophilic moieties described herein. Such polymers or oligomers typically include at least one reactive functional group, for example, halo, hydroxyl, amine, thiol, sulfonic acid, carboxylic acid, isocyanate, epoxy, ester, and the like, which are often at the terminal end of the polymer. These reactive functional groups can be used to attach a lipophilic linear or branched chain alkyl, alkenyl, alkynyl, arylalkyl, or alkylaryl group, or a lipophilic polymer or oligomer, thereby increasing the lipophilicity of the hydrophilic polymers or oligomers (and thereby rendering them generally amphiphilic).

[132] The lipophilic groups can, for example, be derived from mono- or di-carboxylic acids, or where appropriate, reactive equivalents of carboxylic acids such as anhydrides or acid chlorides. Examples of suitable precursors for the lipophilic groups are acetic acid, propionic acid, butyric acid, valeric acid, isobutyric acid, trimethylacetic acid, caproic acid, caprylic acid, heptanoic acid, capric acid, pelargonic acid,

lauric acid, myristic acid, palmitic acid, stearic acid, behenic acid, lignoceric acid, ceratic acid, montanoic acid, isostearic acid, isononanoic acid, 2-ethylhexanoic acid, oleic acid, ricinoleic acid, linoleic acid, linolenic acid, erucic acid, soybean fatty acid, linseed fatty acid, dehydrated castor fatty acid, tall oil fatty acid, tung oil fatty acid, sunflower fatty acid, safflower fatty acid, acrylic acid, methacrylic acid, maleic anhydride, orthophthalic anhydride, terephthalic acid, isophthalic acid, adipic acid, azelaic acid, sebacic acid, tetrahydrophthalic anhydride, hexahydrophthalic anhydride, succinic acid and polyolefin carboxylic acids.

[133] The terminal lipophilic groups need not be equivalent, i.e., the resulting copolymers can include terminal lipophilic groups that are the same or different. The lipophilic groups can be derived from more than one mono or di-functional alkyl, alkenyl, alkynyl, cycloalkyl, arylalkyl or alkylaryl group as defined above.

#### 8.2.5.1 PEG/Alkyl Modifying Moieties

[134] The modifying moiety may be a straight or branched polymeric moiety comprising one or more straight or branched polyalkylene glycol moieties and/or one or more straight or branched, substituted or unsubstituted alkyl moieties. However, in certain embodiments, the modifying moiety specifically does not consist of an alkyl moiety and in other embodiments, the modifying moiety specifically does not consist of an alkane moiety. The polyalkylene glycol moieties in some embodiments include from 2 to 25 polyalkylene glycol subunits, more preferably from 2 to 20, ideally from 2 to 15. The polyalkylene glycol moieties in some embodiments comprise PEG. The alkyl moieties in some embodiments are preferably from 2 to 20, more preferably from 2 to 15, more preferably from 2 to 10 carbon atoms. The alkyl moieties are preferably alkane moieties.

[135] The modifying moiety may, for example, have a formula:

wherein each C is independently selected and is an alkyl moiety having m carbons and m is from 1 to 20, preferably 2 to 15, still more preferably 2 to 10; and each PAG is independently selected and is a polyalkylene glycol moiety having n subunits and n is from 2 to 25, preferably 2 to 18, more preferably 2 to 16; each X is independently selected and is a linking moiety coupling PAG to C, and is preferably -C-, -O-, -C(O)-, -NH-, -NHC(O)-, or -C(O)NH-. With respect to Formulas I and III, and in some embodiments the C<sub>m</sub>-X moiety is absent, and the PAG<sub>n</sub> moiety is terminated with an -OH moiety or an -OCH<sub>3</sub> moiety. For

example, the PAG may be methoxy-terminated or hydroxy-terminated PEG, having 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20 subunits.

[136] It will be appreciated that the oligomer of Formula II is itself an aspect of the invention. The oligomer may be provided, for example, as a secondary alcohol or as an activated oligomer. It will be appreciated that the oligomer of Formula I is itself an aspect of the invention. The oligomer may be provided, for example, as a primary alcohol or as an activated oligomer, and may be used to conjugate biologically active compounds, other than BNP, such as insulin, calcitonin, interferons, growth hormones, etc. The modifying moiety may, for example, have a formula:

[137] Wherein each C is independently selected and is an alkyl moiety having m carbons and m is from 1 to 20, preferably 2 to 15, still more preferably 2 to 10; and each PAG is independently selected and is a polyalkylene glycol moiety having n subunits and n is from 2 to 25, preferably 2 to 18, more preferably 2 to 16; X is -O-, or -NH-; each o is independently selected and is from 1 to 15, preferably 1 to 13, more preferably 1 to 9, more preferably 1 to 6. It will be appreciated that the oligomer of Formula II is itself an aspect of the invention. The oligomer may be provided, for example, as a primary alcohol or as an activated oligomer, and may be used to conjugate biologically active compounds, other than BNP, such as insulin, calcitonin, interferons, growth hormones, etc.

[138] The modifying moiety may, for example, have a formula:

Wherein each C is independently selected and is an alkyl moiety having m carbons and m is from 1 to 20, preferably 1 to 15, still more preferably 1 to 10; and each PAG is independently selected and is a polyalkylene glycol moiety having n subunits and n is from 2 to 25, preferably 2 to 18, more preferably 2 to 16; each X is independently selected and is a linking moiety coupling PAG to C, and is preferably consisting of -C-, -O-, -C(O)-, -NH-, -NHC(O)-, or -C(O)NH-; each o is independently selected and is from 1 to 15,

preferably 1 to 13, more preferably 1 to 9, more preferably 1 to 6. It will be appreciated that the oligomer of Formula I is itself an aspect of the invention. The oligomer may be provided, for example, as a carboxylic acid or as an activated oligomer. With respect to Formulas I and III, and in some embodiments the Cm-X moiety is absent, and the PAGn moiety is terminated with an -OH moiety or an -OCH<sub>3</sub> moiety. For example, the PAG may be methoxy-terminated or hydroxy-terminated PEG, having 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20 subunits.

[139] It will be appreciated that the oligomer of formula III is itself an aspect of the invention. The oligomers may be provided, for example, as a primary alcohol or as an activated oligomer, and may be used to conjugate biologically active compounds other than BNP, such as insulin, calcitonin, interferons, growth hormones, etc.

[140] The pharmaceutical characteristics, such as hydrophilicity / lipophilicity of the conjugates according to embodiments of the present invention can be varied by adjusting the number of PEG monomers, the type and length of alkyl chain, the nature of the PEG-peptide linkage, and the number of conjugation sites. The exact nature of the PEG-peptide linkage can be varied such that it is stable and/or sensitive to hydrolysis at physiological pH or in plasma.

#### 8.2.6 Salt-Forming Moieties

[141] In some embodiments, the modifying moiety comprises a salt-forming moiety. The salt-forming moiety may be various suitable salt-forming moieties as will be understood by those skilled in the art including, but not limited to, carboxylate and ammonium. In some embodiments wherein the modifying moiety includes a salt forming moiety, the natriuretic compound conjugate is provided in salt form. In these embodiments, the natriuretic compound conjugate is associated with a suitable pharmaceutically acceptable counterion as will be understood by those skilled in the art including, but not limited to, negative ions such as chloro, bromo, iodo, phosphate, acetate, carbonate, sulfate, tosylate, and mesylate, or positive ions such as sodium, potassium, calcium, lithium, and ammonium.

[142] The modifying moiety can include any hydrophilic moieties, lipophilic moieties, amphiphilic moieties, salt-forming moieties, and combinations thereof. In preferred embodiments, the modifying moiety is selected from the group consisting of (CH<sub>2</sub>CH<sub>2</sub>O)<sub>p</sub>CH<sub>3</sub> where p is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20; (CH<sub>2</sub>)<sub>q</sub>CH<sub>3</sub> where q is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20; CH<sub>2</sub>CH<sub>2</sub>(OCH<sub>2</sub>CH<sub>2</sub>)<sub>r</sub>OH where r is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20; C(CH<sub>2</sub>OH)<sub>3</sub>; CH(CH<sub>2</sub>OH)<sub>2</sub>; C(CH<sub>3</sub>)<sub>3</sub>; CH(CH<sub>3</sub>)<sub>2</sub>; CH<sub>2</sub>CH<sub>2</sub>(OCH<sub>2</sub>CH<sub>2</sub>)<sub>s</sub>C(O)(CH<sub>2</sub>)<sub>t</sub>CH<sub>3</sub> where s is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20 and t is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20; and (CH<sub>2</sub>CH<sub>2</sub>O)<sub>y</sub>C(O)(CH<sub>2</sub>)<sub>z</sub>CH<sub>3</sub> where y is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20 and z is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20.

[143] The foregoing examples of modifying moieties for specific purposes is intended as illustrative of the invention and should not be taken as limiting in any way. One skilled in the art will recognize that suitable moieties for conjugation to achieve particular functionality will be possible within the bounds of the chemical conjugation mechanisms disclosed and claimed herein. Accordingly, additional moieties can be selected and used according to the principles of the invention as disclosed herein.

### 8.3 Conjugation Strategies

[144] The natriuretic compound conjugates of the invention can have a different level of biological activity relative to the corresponding unconjugated natriuretic compound conjugates. In some embodiments, the natriuretic compound retains some or all of the activity of the unmodified form, but by virtue of factors such as the degree of conjugation with modifying moieties, selection of conjugation sites on the molecule and selection of modifying moieties, is less susceptible to *in vivo* degradation, and thus, has an increased plasma half life. For example, the natriuretic compounds of the invention may be modified to include a modifying moiety at one, two, three, four, five, or more sites on the natriuretic compound structure at appropriate attachment (i.e., modifying moiety conjugation) sites suitable for facilitating the association of a modifying moiety thereon. By way of example, such suitable conjugation sites may comprise an amino acid residue, such as a Lys amino acid residue.

[145] In many embodiments, for example, the biologically active agent functions, in part, by binding to an active site in a receptor. Often, when a functional group, such as an amino acid residue is modified, the agent no longer binds in the active site. In the case of BNP, for example, the peptide has a particular affinity for binding NPR-A. Depending on the site at which the natriuretic molecule is modified to include the modifying group, the affinity that the BNP has for the receptor may be the same, or may be reduced. In some embodiments, the natriuretic compound conjugates have less activity than the native, unconjugated natriuretic compound conjugates, but retain improved characteristics relative to unconjugated natriuretic compound conjugates, such as increased resistance to proteolysis and plasma half life or ability to cross a cell membrane. It is envisioned that reduced activity can be preferred, for example, when long term release of the natriuretic compound is desirable.

[146] In some embodiments, the natriuretic compound conjugates are monoconjugates. In other embodiments, the natriuretic compound conjugates are multi-conjugates, such as di-conjugates, tri-conjugates, tetra-conjugates, penta-conjugates and the like. The number of modifying moieties on the natriuretic compound is limited only by the number of conjugation sites on the natriuretic compound. In still other embodiments, the natriuretic compound conjugates of the present invention are a mixture of mono-, di-, tri, tetra, and/or penta-modifying moiety conjugates. For example, in some embodiments, the biologically active natriuretic compound is hBNP, which includes within its 32 native amino acid sequence includes four preferred conjugation sites, including the N-terminus, Lys<sup>3</sup>, Lys<sup>14</sup> and Lys<sup>27</sup>. The work of the

inventors points to monoconjugates conjugated at the N-terminus, Lys<sup>3</sup>, Lys<sup>14</sup> or Lys<sup>27</sup>, and diconjugates at Lys<sup>3</sup>/Lys<sup>14</sup> and Lys<sup>3</sup>/Lys<sup>27</sup> as highly preferred strategies for hBNP and related natriuretic peptides and analogs.

[147] The modifying moiety is preferably covalently coupled to the natriuretic compound. More than one moiety on the modifying moiety may be covalently coupled to the natriuretic compound. Coupling may employ hydrolysable or non-hydrolysable bonds or mixtures of the two (i.e., different bonds at different conjugation sites).

[148] In some embodiments, the natriuretic compound is coupled to the modifying moiety utilizing a hydrolysable bond (e.g., an ester, carbonate or carbamate bond). Use of a hydrolysable coupling will provide a natriuretic compound conjugate that acts as a prodrug. A prodrug approach may be desirable where the natriuretic compound-modifying moiety conjugate is inactive (i.e., the conjugate lacks the ability to affect the body through the natriuretic compound's primary mechanism of action), such as when the modifying moiety conjugation site is in a binding region of natriuretic compound. Use of a hydrolyzable coupling can also provide for a time-release or controlled-release effect, administering the natriuretic compound over a given time period as one or more modifying moieties are cleaved from their respective natriuretic compound-modifying moiety conjugates to provide the active drug.

[149] In other embodiments, the natriuretic compound is coupled to the modifying moiety utilizing a non-hydrolyzable bond (e.g., a carbamate, amide, or ether bond). Use of a non-hydrolyzable bond may be preferable when it is desirable to allow the natriuretic compound-modifying moiety conjugate to circulate in the bloodstream for an extended period of time, preferably at least 2 hours. Bonds used to covalently couple the natriuretic compound to the modifying moiety in a non-hydrolysable fashion are typically selected from the group consisting of covalent bond(s), ester moieties, carbonate moieties, carbamate moieties, amide moieties and secondary amine moieties.

[150] In still other embodiments, a partial prodrug approach may be used, in which a portion of the modifying moiety is hydrolyzed. For example, U.S. Patent 6,309,633 (the entire disclosure of which is incorporated herein by reference) describes modifying moieties comprising hydrophilic and lipophilic components in which the lipophilic components hydrolyze *in vivo* to yield a micropegylated conjugate.

[151] More than one modifying moiety (i.e., a plurality of modifying moieties) may be coupled to the natriuretic compound. The modifying moieties in the plurality are preferably the same. However, it is to be understood that the modifying moieties in the plurality may be different from one another, or, alternatively, some of the modifying moieties in the plurality may be the same and some may be different. When a plurality of modifying moieties are coupled to the natriuretic compound, it may be preferable to couple one or more of the modifying moieties to the natriuretic compound with hydrolyzable bonds and couple one or

more of the modifying moieties to the natriuretic compound with non-hydrolyzable bonds. Alternatively, all of the bonds coupling the plurality of modifying moieties to the natriuretic compound may be hydrolyzable, but have varying degrees of hydrolyzability such that, for example, one or more of the modifying moieties may be rapidly removed from the natriuretic compound by hydrolysis in the body and one or more of the  
5 modifying moieties is slowly removed from the natriuretic compound by hydrolysis in the body.

[152] The modifying moiety may be coupled to the natriuretic compound at various nucleophilic residues of the drug including, but not limited to, nucleophilic hydroxyl functions and/or amino functions. Nucleophilic hydroxyl functions may be found, for example, at serine and/or tyrosine residues, and nucleophilic amino functions may be found, for example, at histidine and/or Lys residues, and/or at the one  
10 or more N-terminus of the polypeptide. When a modifying moiety is coupled to the N-terminus of the natriuretic peptide, coupling preferably forms a secondary amine.

#### 8.4 Synthesis of the Conjugates

[153] Exemplary syntheses are described in the examples set forth below. The reaction conditions (e.g., selected molar ratios, solvent mixtures and/or pH) may be controlled according to known principles. For  
15 example, conjugation at the amino functionality of Lys may be suppressed by maintaining the pH of the reaction solution below the  $pK_a$  of Lys.

[154] The mixture of natriuretic compound conjugates may be separated and isolated utilizing, for example, HPLC to provide natriuretic compound conjugates, for example mono-, di-, or tri-conjugates. The degree of conjugation (e.g., whether the isolated molecule is a mono-, di-, or tri-conjugate) of a particular  
20 isolated conjugate may be determined and/or verified utilizing various techniques as will be understood by those skilled in the art including, but not limited to, mass spectroscopy. The particular conjugate structure (e.g., Lys<sup>3</sup>, Lys<sup>14</sup>, Lys<sup>27</sup>, or the N-terminus of hBNP monoconjugate) may be determined and/or verified utilizing various techniques as will be understood by those skilled in the art including, but not limited to, sequence analysis, peptide mapping, selective enzymatic cleavage, and/or endopeptidase cleavage.

[155] One or more of the reaction sites on the natriuretic compound may be blocked by, for example, reacting the natriuretic compound with a suitable blocking reagent such as N-tert-butoxycarbonyl (t-BOC), or N-(9-fluorenylmethyloxycarbonyl) (N-FMOC). This process may be preferred, for example, when it is desired to form an unsaturated natriuretic compound conjugate (i.e., a conjugate wherein not all nucleophilic residues are conjugated) having a modifying moiety at one or more of the N-terminus of the polypeptide.  
25 Following such blocking, the substantially monodispersed mixture of blocked natriuretic compounds may be reacted with the substantially monodispersed mixture of activated modifying moieties to provide a mixture of natriuretic compound conjugates having modifying moiety(s) coupled to one or more nucleophilic residues and having blocking moieties coupled to other nucleophilic residues. After the conjugation reaction, the natriuretic compound-modifying moiety conjugates may be de-blocked as will be understood  
30

by those skilled in the art. If necessary, the mixture of natriuretic compound conjugates may then be separated as described above to provide a mixture of natriuretic compound conjugates. Alternatively, the mixture of natriuretic compound-modifying moiety conjugates may be separated prior to de-blocking.

[156] In a surprising aspect of the invention, the inventors discovered that synthesis of an hBNP conjugate using a PEG-alkyl moiety with the alkyl moiety adjacent to the natriuretic compound (i.e., positioned between the natriuretic compound and the PEG moiety) results in preferential conjugation at the highly desirable Lys<sup>3</sup> conjugation site. Thus, in one aspect, the invention provides a method of preferentially conjugating hBNP at Lys<sup>3</sup> comprising activating the alkyl component of a PEG-alkyl oligomer and coupling the activated PEG-alkyl oligomer to the hBNP.

## 8.5 Pharmaceutical Compositions

[157] Pharmaceutical compositions including the natriuretic compound conjugates described herein can be prepared. Such compositions typically include the modified natriuretic compound in combination with, or in admixture with, a pharmaceutically acceptable carrier. The carrier must, of course, be acceptable in the sense of being compatible with any other ingredients in the pharmaceutical composition and should not be deleterious to the patient. The carrier may be a solid or a liquid, or both, and is preferably formulated with the prodrug as a unit-dose formulation, for example, a tablet, which may contain from about 0.01 or 0.5% to about 95% or 99% by weight of the natriuretic compound conjugate. The pharmaceutical compositions may be prepared by any of the well-known techniques of pharmacy including, but not limited to, admixing the components, optionally including one or more accessory ingredients.

[158] The pharmaceutical compositions according to embodiments of the present invention include those suitable for oral, rectal, nasal, topical, inhalation (e.g., via an aerosol) buccal (e.g., sub-lingual), vaginal, parenteral (e.g., subcutaneous, intramuscular, intradermal, intraarticular, intrapleural, intraperitoneal, intracerebral, intraarterial, or intravenous), topical (i.e., both skin and mucosal surfaces, including airway surfaces) and transdermal administration, although the most suitable route in any given case will depend on the nature and severity of the condition being treated and on the nature of the particular prodrug which is being used.

[159] Pharmaceutical compositions suitable for oral administration may be presented in discrete units, such as capsules, cachets, lozenges, or tablets, each containing a predetermined amount of the prodrug; as a powder or granules; as a solution or a suspension in an aqueous or non-aqueous liquid; or as an oil-in-water or water-in-oil emulsion. Such formulations may be prepared by any suitable method of pharmacy that includes the step of bringing into association the prodrug and a suitable carrier (which may contain one or more accessory ingredients as noted above). In general, the pharmaceutical composition according to embodiments of the present invention are prepared by uniformly and intimately admixing the prodrug with a liquid or finely divided solid carrier, or both, and then, if necessary, shaping the resulting mixture. For

example, a tablet may be prepared by compressing or molding a powder or granules containing the prodrug, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing, in a suitable machine, the mixture in a free-flowing form, such as a powder or granules optionally mixed with a binder, lubricant, inert diluent, and/or surface active/dispersing agent(s). Molded tablets may be made by molding, in a suitable machine, the powdered compound moistened with an inert liquid binder.

[160] Pharmaceutical compositions suitable for buccal (sub-lingual) administration include lozenges comprising the prodrug in a flavored base, usually sucrose and acacia or tragacanth; and pastilles comprising the prodrug in an inert base such as gelatin and glycerin or sucrose and acacia.

[161] Pharmaceutical compositions according to embodiments of the present invention suitable for parenteral administration comprise sterile aqueous and non-aqueous injection solutions of the prodrug, which preparations are preferably isotonic with the blood of the intended recipient. These preparations may contain anti-oxidants, buffers, bacteriostats and solutes which render the composition isotonic with the blood of the intended recipient. Aqueous and non-aqueous sterile suspensions may include suspending agents and thickening agents. The compositions may be presented in unit dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of the sterile liquid carrier, for example, saline or water-for-injection immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described. For example, an injectable, stable, sterile composition comprising a prodrug in a unit dosage form in a sealed container may be provided. The prodrug is provided in the form of a lyophilizate which is capable of being reconstituted with a suitable pharmaceutically acceptable carrier to form a liquid composition suitable for injection thereof into a subject. The unit dosage form typically comprises from about 10 mg to about 10 grams of the prodrug. When the prodrug is substantially water-insoluble, a sufficient amount of emulsifying agent which is physiologically acceptable may be employed in sufficient quantity to emulsify the prodrug in an aqueous carrier. One such useful emulsifying agent is phosphatidyl choline.

[162] Pharmaceutical compositions suitable for topical application to the skin preferably take the form of an ointment, cream, lotion, paste, gel, spray, aerosol, or oil. Carriers which may be used include petroleum jelly, lanolin, polyethylene glycols, alcohols, transdermal enhancers, and combinations of two or more thereof.

[163] Pharmaceutical compositions suitable for transdermal administration may be presented as discrete patches adapted to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. Compositions suitable for transdermal administration may also be delivered by iontophoresis (see, for example, *Pharmaceutical Research* 3 (6):318 (1986)) and typically take the form of an optionally buffered

aqueous solution of the prodrug. Suitable formulations comprise citrate or bis/tris buffer (pH 6) or ethanol/water and contain from 0.1 to 0.2M active ingredient.

## 8.6 Methods of Administration and Treatment

[164] The natriuretic compound conjugates and pharmaceutical formulations of the invention exhibit one or more improved characteristics relative to the unmodified (unconjugated) biologically active natriuretic compound, the addition of the modifying moiety can protect the biologically active natriuretic compound, from degradation in various environments (such as the gastrointestinal tract (GI tract)), such that less of it is degraded in the unmodified form than would be degraded in the absence of the modifying moiety in such environments. In particular, certain modified forms of the invention can be orally administered in a dosage that ultimately provides a pharmaceutically acceptable amount of the biologically active natriuretic compound in systemic circulation. That is to say, a sufficient amount of natriuretic compound can survive in the GI tract and enter the bloodstream such that the biologically active natriuretic compound is systemically present in a pharmacologically active amount sufficient to trigger production of cGMP. Preferably, the addition of the modifying moiety improves the delivery of orally administered unconjugated natriuretic compound into the bloodstream upon oral administration relative to the delivery of orally administered unconjugated natriuretic compound into the bloodstream. More preferably, the improvement of the delivery of active compound into the bloodstream for orally administered natriuretic compound conjugates is at least 2 times the delivery of orally administered unconjugated parent biologically active natriuretic compound, into the bloodstream. Still more preferably, the improvement of the delivery of active compound into the bloodstream for orally administered natriuretic compound conjugates is at least 3, 4, 5, 6, 7, 8, 9, 10, 15, 20, 25, 30, 40, 50, 60, 70, 80, 90, 100, 150, 200, 300, 400, or 500 times the delivery of orally administered unmodified (unconjugated) biologically active natriuretic compound, into the bloodstream. Thus, administration of the natriuretic compound conjugates of the invention can provide greater bioavailability of the biologically active natriuretic compound relative to administration of unmodified biologically active natriuretic compound. An oral route of administration (instead of by continuous intravenous infusion for days in a hospital setting) may reduce hospital costs associated with other CHF therapies and/or expand the therapeutic use of hBNP to include early stage and chronic CHF as well as acute CHF.

[165] Thus, in one aspect, the invention provides a method of treating a disease condition susceptible to treatment using a natriuretic peptide compound by administering to a subject in need thereof a therapeutically effective amount of a natriuretic compound conjugate of the invention. The natriuretic compound conjugate may be suitably administered by a variety of routes, including for example, parenteral and enteral routes. Examples of preferred routes include oral, subcutaneous, sublingual, buccal, nasal, intravenous and intramuscular.

[166] Several approaches may be used in the use of the present natriuretic compound conjugates for the treatment of heart failure. For example, it is envisioned that the natriuretic compound conjugates can be presented as a monotherapy, preferably in an oral dosage form alone. Alternatively, the natriuretic compound conjugates may be used together with more conventional therapeutic agents as part of a combination therapy. The primary categories of drugs that are currently used include the following:

[167] Diuretics – alleviate the fluid accumulation and resultant stretching of the heart associated with CHF.

[168] Vasodilators – expand arteries and veins, allowing for increased blood flow.

[169] Inotropic agents – increase the force of contraction of cardiac muscle.

[170] Digitalis drugs – increase force of contraction of the heart and reduce heart rate.

[171] Angiotensin converting enzyme (ACE) inhibitors – inhibit the production of the vasoconstrictor angiotensin II in the last stage of its synthesis.

[172] Angiotensin receptor blockers (ARB's) – permit angiotensin to be produced, but inhibit its arterial activity.

[173] Calcium channel blockers – inhibit calcium influx, resulting in vascular and smooth muscle relaxation.

[174] Nitrates – relax smooth muscles and dilate veins and arteries.

[175] Beta-blockers – block the action of catecholamines, resulting in less stress on the heart and lower force and rate of contraction.

[176] Some of the advantages of the natriuretic compound conjugates can be considered first in relation to the other approaches to treat CHF and compared to the current use of the natriuretic peptide in its unmodified form, that is continuously infused. The oral natriuretic compound conjugates of the invention exhibit natriuretic and diuretic properties that may be expected to relieve congestion through the elimination of sodium and excess water. Such functions are currently addressed with diuretics and potassium supplements. The natriuretic compound conjugates of the invention are expected to possess vascular and myocardial relaxant properties that are currently effected using vasodilators, calcium channel blockers, and nitrates. The natriuretic compound conjugates of the invention are expected to inhibit the renin-angiotensin-aldosterone system (RAAS) currently effected using ACE inhibitors and ARB's. Moreover, the natriuretic compound conjugates are expected to lack the negative effects and risk of sudden death associated with the inotropic and digitalis drugs. The natriuretic compound conjugates may have many, if not all, of the benefits

of several groups of cardiovascular drugs while having a reduced amount of or lacking the negative effects of conventional therapies.

[177] The natriuretic compound-conjugates of the invention also have advantages over NATRECOR® (nesiritide, made by Scios, Inc., Sunnyvale, CA). Some of the advantages can be attributed to the enhanced pharmacokinetic profile that amphiphilic oligomers according to embodiments of the present invention provide. For example, resistance to degradation by proteases (such as NEP) may lead to a longer circulating half-life as compared to the unconjugated peptide. A significant advantage may result from the ability of BNP or ANP conjugated with such oligomers to be delivered orally. For instance, NATRECOR® is dosed by continuous infusion over 48 hours and carries a high cost per dose plus hospital costs. An oral hBNP compound conjugate according to embodiments of the present invention may be dosed at an overall lower cost, and may be available on an outpatient basis and may be self-administered. Instead of being limited to use with inpatients having the most acute cases of CHF, oral conjugates according to embodiments of the present invention can be used for those suffering with the gradual onset of chronic CHF. The ease of administration, reduced demand on hospital resources, and/or lower cost support the utility of an the natriuretic compound conjugates as a preventative therapy, self administered (e.g., at home) for those patients who are at high risk of heart failure. Oral preparations of the hBNP compound conjugate according to embodiments of the present invention are thus expected to have many, if not all the benefits of Natrecor®, with the advantages of an improved pharmacokinetic profile, greater ease of administration, reduced hospitalization expenses, expansion of indication to include chronic CHF, and/or utility in early-stage cardiovascular disease.

[178] Subjects taking or inclined to take the parent natriuretic compound can alternatively (or additionally) take the natriuretic compound preparation described herein. For example, patients suffering from disorders that are conventionally treated using a parenterally administered natriuretic compound, such as NATRECOR®, can be treated using an effective amount of the modified form of that agent described herein. Advantageously, where such agents were previously only administrable via injection or intravenous administration, the natriuretic compound can be administered via inhalation or, more preferably, oral administration.

[179] In one embodiment, the invention provides a method of delivering a biologically active agent to a subject, wherein the biologically active agent is orally administered as a component of a modified natriuretic compound of the invention, a portion of the orally administered natriuretic compound survives intact in the GI tract and traverses the intestinal wall to enter the bloodstream, and after leaving the GI tract, some or all of the natriuretic compound is hydrolyzed *in vivo* to yield a pharmaceutically acceptable amount of the biologically active agent. The hydrolysis may, for example, take place in the bloodstream or in the liver. In this method, the modified forms of the natriuretic compound enhances the oral bioavailability of the orally

administered biologically active agent relative to the oral bioavailability of a corresponding orally administered unconjugated biologically active agent.

[180] The effective amount of any natriuretic the use of which is in the scope of present invention, will vary somewhat from agent to agent, and patient to patient, and will depend upon factors such as the age and condition of the patient and the route of delivery. Such dosages can be determined in accordance with routine pharmacological procedures known to those skilled in the art. As a general proposition, a dosage from about 0.1 to about 50 mg/kg will have therapeutic efficacy, with all weights being calculated based upon the weight of the patient. Toxicity concerns at the higher level may restrict intravenous dosages to a lower level such as up to about 10 mg/kg, with all weights being calculated based upon the weight of the active base. A dosage from about 10 mg/kg to about 50 mg/kg may be employed for oral administration. Typically, a dosage from about 0.5 mg/kg to 5 mg/kg may be employed for intramuscular injection. The frequency of administration is usually one, two, or three times per day or as necessary to control the condition. The duration of treatment depends on the type of condition being treated and may be for as long as the life of the patient.

[181] Suitable subjects to be treated according to the present invention include, but are not limited to, avian and mammalian subjects, preferably mammalian. Mammals according to the present invention include but are not limited to canine, felines, bovines, caprines, equines, ovines, porcines, rodents (*e.g.* rats and mice), lagomorphs, primates, humans, and the like, and encompass mammals *in utero*. Any mammalian subject in need of being treated according to the present invention is suitable. Human subjects are preferred. Human subjects of both genders and at any stage of development (*i.e.*, neonate, infant, juvenile, adolescent, adult) can be treated according to the present invention.

[182] Illustrative avians according to the present invention include chickens, ducks, turkeys, geese, quail, pheasant, ratites (*e.g.*, ostrich) and domesticated birds (*e.g.*, parrots and canaries), and include birds *in ovo*.

#### 8.7 Assays

[183] Natriuretic peptide analogs of the invention may induce the cardiovascular, renal, and/or endocrine effects that are associated with the native peptide. Cell based assays may be used to show which conjugates are proficient agonists of the human natriuretic peptide receptor A, leading to the suitable production of cGMP. Biochemical assays may be used to show which conjugates offer the suitable protection against proteolytic enzymes. In vivo experiments may be used to show which conjugates afford a desirable bioavailability. Leading conjugates can be tested in established dog models. Desirable candidates may be subjected to detailed pharmacokinetic, pharmacodynamic, and toxicity studies in rats and dogs. BNP conjugates according to embodiments of the present invention will be useful for the treatment of early-stage, chronic, and acute congestive heart failure.

[184] The novel peptides and novel conjugates of the invention can be tested for agonist activity at the human natriuretic peptide receptor A (NPR-A) *in vitro*. The vasorelaxant, natriuretic, and diuretic properties of BNP are ascribed to a secondary messenger, cyclic GMP (cGMP). The production of cGMP is accomplished by guanylate cyclase, an enzyme that is activated when BNP binds to NPR-A. cGMP production can be measured in cultures of human aortic endothelial cells that endogenously express NPR-A. Thus, the relative activity of the natriuretic compound conjugates and natriuretic peptide analogs of the invention can be determined by the level of cGMP production in these cells.

[185] The conjugates of the invention can be tested for increased resistance to proteases. In general, drugs that are delivered orally are subjected to digestive enzymes such as pepsin, trypsin, and/or chymotrypsin. In the case of peptide drugs, these enzymes may be particularly problematic. However, peptide conjugation has been shown to increase resistance to these enzymes. Digestive enzyme cocktails can be used to test for increased resistance of hBNP conjugates and other conjugates of the invention to proteases of the digestive tract. Natriuretic compound conjugates are preferably less susceptible to proteolytic degradation than corresponding unconjugated natriuretic compounds, i.e., the conjugates digest more slowly than the corresponding unconjugated compound.

[186] The conjugates can be tested for oral bioavailability. Oral bioavailability of the conjugates can be tested in rats, for example. The conjugates can be administered to the gastrointestinal tract by oral gavage and the presence of hBNP conjugates in the bloodstream can be assayed using available radioimmunoassay procedures. Conjugates according to embodiments of the present invention may preferably be orally and/or perorally available, i.e., a therapeutically significant amount of the conjugate can be delivered by the oral and/or peroral routes.

[187] The conjugate may retain some or all of the activity of native natriuretic peptide (e.g., hBNP) with the additional benefits of oral administration. Such a compound may lower costs associated with treatment of acute CHF and/or expand the applicability of this therapeutic to include early stage and chronic CHF.

[188] In one aspect, the invention provides a method of generating data comprising assaying a natriuretic compound, assaying a natriuretic compound conjugate of the invention or a series of such natriuretic compound conjugates, and compiling data resulting from such assaying. The data itself is therefore understood to constitute yet another embodiment of the invention, as well as the use of this data.

## 8.8 Oligomeric Modifying Moieties

The present invention also provides several PEG linear and branched, amine, micropegylated and alkyl-PEG modifying moieties. For example, the present invention provides a compound having a formula:

wherein each C is independently selected and is an alkyl moiety having m carbons and m is from 1 to 20; and each PAG is independently selected and is a polyalkylene glycol moiety having n subunits and n is from 2 to 25; each X is independently selected and is a linking moiety.

- 5 Alternatively, C, m, X, PAG, and n are as described above for Formula I. With respect to Formulas I and III, and in some embodiments the Cm-X moiety is absent, and the PAGn moiety is terminated with an -OH moiety or an -OCH3 moiety. For example, the PAG may be methoxy-terminated or hydroxy-terminated PEG, having 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20 subunits.

10

The invention in other embodiments provides a compound having a formula:

wherein each C is independently selected and is an alkyl moiety having m carbons and m is from 1 to 20; and each PAG is independently selected and is a polyalkylene glycol moiety having n subunits and n is from 2 to 25; each X is independently selected and is a linking moiety.

- 15 Alternatively, C, m, X, PAG, and n are as described above for Formula I. With respect to Formulas I and III, and in some embodiments the Cm-X moiety is absent, and the PAGn moiety is terminated with an -OH moiety or an -OCH3 moiety. For example, the PAG may be methoxy-terminated or hydroxy-terminated PEG, having 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19 or 20 subunits.
- 20

In yet another aspect, the invention provides a compound having a formula:

In this compound, PAG is a polyalkylene glycol moiety having  $n$  subunits and  $n$  is from 2 to 25;  $X$  is O or N; and each  $o$  is independently selected and is from 1 to 15. Alternatively, PAG,  $m$ , and  $X$  are as described above for Formula II.

5 The present invention also presents a compound having a formula:

PAG is a polyalkylene glycol moiety having  $n$  subunits and  $n$  is from 2 to 25;  $X$  is O or N; and each  $o$  is independently selected and is from 1 to 15. Alternatively, PAG,  $m$ , and  $X$  are as described above for Formula II.

10

In yet another embodiment, a compound is provided having a formula:

15 wherein each  $C$  is independently selected and is an alkyl moiety having  $m$  carbons and  $m$  is from 1 to 20; and each PAG is independently selected and is a polyalkylene glycol moiety having  $n$  subunits and  $n$  is from 2 to 25; each  $X$  is independently selected and is a linking moiety, and  $o$  is from 1 to 15. Alternatively,  $C$ ,  $m$ , PAG,  $X$  and  $n$  are as described above for Formula III.

The invention also provides a compound having a formula:

wherein each C is independently selected and is an alkyl moiety having m carbons and m is from 1 to 20; and each PAG is independently selected and is a polyalkylene glycol moiety having n subunits and n is from 2 to 25; each X is independently selected and is a linking moiety; o is from 1 to 15. Alternatively, C, m, PAG, X and n are as described above for Formula III.

The present invention also provides several methods for preparing the modifying moieties disclosed herein. A method of making a compound of the formula:

is provided, wherein C, m, X, PAG, and n are as described above for Formula I. This method may be described as comprising the steps of reacting a compound of formula:

with a compound of formula:

in the presence of a base and a solvent to yield a product "a":

reacting the product a with a compound of formula:

in the presence of a Lewis acid and a solvent to yield:

- 5 wherein C, m, X, PAG, and n as defined above for Formula I. Cl may be replaced with another halogen, such as Br. By way of example, the base may be further defined as NaH, and the solvent may be further defined as tetrahydrofuran. The Lewis acid to be used in this method may also be further defined as  $BF_3OEt_2$ .

Another method of the invention is also disclosed for making a compound of the formula:

10 wherein C, m, X, PAG and n are as defined above for Formula I. This method may be further defined as comprising the steps of reacting a product

- 15 wherein C, m, X, PAG, and n defined as above, with paranitrochloroformate or disuccimidyl carbonate.

Yet another embodiment of the invention is provided in a method of making a compound of the formula:

wherein PAG, n, X, and o are as defined above for Formula II. This method may be further described as comprising the steps of reacting a compound of formula:

- 5 wherein o is as defined above for Formula I, with a compound of formula:

wherein X is -NH or -OH, in a solvent, to yield a compound of formula:

wherein PAG, n, X, and o are as defined above for Formula II.

- 10 The invention also provides a method of making a compound of the formula:

(Formula VII)

wherein PAG, n, X, and o are defined above for Formula II. This method may be described as comprising the steps of activating a product

(wherein PAG, n, X, and o are defined above for Formula II using an activating agent, such as disuccinimidyl carbonate, paranitrochloroformate, phosgene and N-hydroxysuccinimide.

1. Yet another embodiment of the invention provides a method of making a compound of the formula:

wherein C, m, PAG, n, and o are as defined above for Formula III. This method may be described as comprising the steps of reacting the product identified here as Formula IV above with a compound of formula:

- 10 in the presence of a base in a solvent, wherein o is as defined above for Formula III. In preferred embodiments of this method, the base is  $K_2CO_3$  and the solvent is an aqueous and/or organic solvent.
2. In addition, the invention further provides a method of making a compound of the formula:

wherein C, m, PAG, n, and o are as defined above for Formula III. The method generally comprises reacting a compound produced according to the method of preparing the Formula VIII as defined above, with an activating agent such as N-hydroxysuccinimide.

## 9. Examples

[189] The following examples have been included to illustrate models of the invention. Certain aspects of the following examples are described in terms of techniques and procedures found to demonstrate the best mode of practicing the invention. In light of the present disclosure and the general level of skill known in the relevant art of the present invention, those of skill will appreciate that the following examples are intended to be exemplary only and that numerous changes, modifications, and alterations can be employed without departing from the scope of the invention.

### 9.1 Activation of PEG-Alkyl Modifying Moiety (carbonyl acid 2,5-dioxo-pyrrolidin-1-yl ester 2-[2-(2-[2-(2-hexadecyloxy-ethoxy)-ethoxy]-ethoxy)-ethoxy]-ethyl ester (II))

[190] Hexaethyleneglycol monohexadecyl ether, I (0.202 g, 0.4 mmol) was dissolved in acetonitrile (5 mL) and disuccinimidyl carbonate (DSC, 0.157 g, 0.6 mmol) was added. Then triethylamine (0.12 g, 1.2 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~ 16 hours, the crude reaction was evaporated to dryness and then dissolved in saturated NaHCO<sub>3</sub> (10 mL), washed with ethyl acetate (2 x 20 mL), dried over MgSO<sub>4</sub>, and evaporated to dryness. The crude product mixture was purified *via* column chromatography (silica, EtOAc/methanol, 10:1) to yield 0.258 g (81%) of the title compound II as an oil. ESI MS: *m/e* 648.84 (M+H)<sup>+</sup>.

**9.2 Synthesis of Branched PEG Amine Modifying Moiety (carbonic acid 2,5-dioxo-pyrrolidin-1-yl ester 2-[2-(2-hexyl-decanoylamino)-ethoxy]-ethyl ester (IV))**

[191] Thionyl chloride (5.5 gm, 46.6 mmol) was added drop wise over a period of thirty minutes to a solution of 2-Hexyl-decanoic acid **I** (10 gm, 38.9 mmol) in 100 mL carbon tetrachloride. After the addition was complete, the reaction mixture was refluxed for 3 hours. After the reaction was complete, the carbon tetrachloride was removed by distillation and the reaction mixture was concentrated to get crude acid chloride. The crude acid chloride was purified by fractional distillation to obtain **II** as a clear liquid (10.1 gm, 91%). ESI MS:  $m/e$  275.87 (M+H)<sup>+</sup>.

[192] To a cooled solution of 2-(2-Amino-ethoxy)-ethanol (575 g, 5.47 mmol) in 10 ml dichloromethane, 2-hexyl-decanoyl chloride **II** (750 mg, 2.74 mmol) was added drop wise over a period of thirty minutes. After the addition was complete, the temperature of the reaction mixture temperature was increased to 25 °C. Reaction was stirred overnight at room temperature. After stirring for ~20 hours, the crude reaction was acidified with 1NHCl and diluted with 10 ml H<sub>2</sub>O. The reaction mixture was then extracted with dichloromethane. The organic layer was then washed with 1N HCl, water, dried over MgSO<sub>4</sub>, filtered and concentrated. Crude material was purified by flash chromatography (silica, gradient elution: 2-5 % methanol in CHCl<sub>3</sub>), to yield 902 mg (96%) of the monodispersed compound **III** as an off-white solid. ESI MS:  $m/e$  344.54 (M+H)<sup>+</sup>.

[193] Monodispersed branched C16-PEG2 **III** (200 mg, 0.58 mmol) was dissolved in acetonitrile (5 mL) and disuccinimidyl carbonate (DSC, 0.224 g , 0.87 mmol). Then triethylamine (0.118 g , 1.17 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred at room temperature overnight. After stirring for ~16 hours, the crude reaction was evaporated to dryness and then dissolved in saturated NaHCO<sub>3</sub> (10 mL), washed with ethyl acetate (2 x 20 mL), dried over MgSO<sub>4</sub>, and evaporated to dryness. The residue was purified *via* column chromatography (silica, EtOAc/methanol, 10:1) to yield 0.206 g (74%) of the oil **IV** (0.206 g, 74% yield). ESI MS:  $m/e$  485.63 (M+H)<sup>+</sup>.

**9.3 Synthesis and Activation of PEG-Alkyl Modifying Moiety (16-(2-{2-[2-(2-{2-[2-(2-Methoxy-ethoxy)-ethoxy]-ethoxy}-ethoxy)-ethoxy]-ethoxy}-hexadecanoic acid 2,5-dioxo-pyrrolidin-1-yl ester)**

- 5 [194] To a solution of monodispersed 16-bromo-hexadecanoic acid (15.3 g, 45 mmol) in ethanol (300 mL) was added H<sub>2</sub>SO<sub>4</sub> (1.5 mL, 31.25 mmol) and the reaction was stirred for 48 h. The crude reaction mixture was diluted with water and extracted with dichloromethane (2 x 300 mL). The organic layer was washed with H<sub>2</sub>O (300 mL), sat. NaHCO<sub>3</sub> (2 x 300 mL), H<sub>2</sub>O (300 mL), dried MgSO<sub>4</sub>, and evaporated to dryness to afford a off-white solid **II** (16.03 g, 98% yield).
- 10 [195] To a solution of monodispersed heptaethylene glycol monomethyl ether (8.51 g, 25 mmol) in THF (250 mL) was added potassium t-butoxide (3.1 g, 27.5 mmol, small portions over ~30 min). The reaction mixture was then stirred for 1 h and then **II** (10 g, 27.5 mol) dissolved in THF (90 mL) was added dropwise and the reaction mixture was stirred overnight. The crude reaction mixture was filtered through Celite (washed CH<sub>2</sub>Cl<sub>2</sub>, ~200 mL) and evaporated to dryness to afford oil. The crude oil was purified via flash chromatography (silica, gradient elution: 2-5 % methanol in CHCl<sub>3</sub>) to give clear yellow oil **IV**, 2.48 g (16 %).
- 15 [196] To the oil of the monodispersed compound **IV** (2.22 g, 3.56 mmol) was added 1N NaOH (50.0 mL), 25 mL methanol, 25 mL ethanol and the reaction mixture was stirred for 24 h. The crude reaction mixture was concentrated, acidified (pH~2), saturated with NaCl, and washed CH<sub>2</sub>Cl<sub>2</sub> (3 x 75 mL). The organic layers were combined, washed sat. NaCl, dried MgSO<sub>4</sub>, and evaporated to dryness to afford the monodispersed compound **V** as a white solid. The crude solid was purified via flash chromatography (silica, ethyl acetate) to give **V**, 858 mg (40 %).
- 20 [197] Monodispersed mPEG7-C16-acid **V** (324 mg, 544 mmol) was dissolved in 15 ml of anhydrous methylene chloride and then solution of N-hydroxysuccinimide (94 mg, 816 mmol) and 1-ethyl-3-(3'-dimethylaminopropyl) carbodiimide. HCl (EDCI·HCl, 156 mg, 816 mmol) in anhydrous methylene chloride added. Reaction was stirred for 24 hours, then washed with 1N HCl, water, dried over MgSO<sub>4</sub>, filtered and concentrated. Crude material was purified by flash chromatography (silica, gradient elution: 2-5 % methanol in CHCl<sub>3</sub>), to afford monodispersed activated MPEG7-C16 **VI** as a clear oil (290 mg, 77%).
- 25

**9.4 Activation of PEG-Alkyl Modifying Moiety (12-(2-{2-[2-(2-{2-[2-(2-Methoxy-ethoxy)-ethoxy]-ethoxy}-ethoxy)-ethoxy]-ethoxy}-ethoxy)-dodecanoic acid 2,5-dioxo-pyrrolidin-1-yl ester)**

[198] Monodispersed mPEG7-C12-acid **I** (500 mg, 0.78 mmol) was dissolved in 20 ml of anhydrous methylene chloride and then solution of N-hydroxysuccinimide (160 mg, 1.39 mmol) and 1-ethyl-3-(3'-dimethylaminopropyl)carbodiimide. HCl (EDCI-HCl, 233 mg, 1.390 mmol) in anhydrous methylene chloride added. Reaction was stirred for 24 hours, then washed with 1N HCl, water, dried over MgSO<sub>4</sub>, filtered and concentrated. Crude material was purified by flash chromatography (silica, gradient elution: 2-5 % methanol in CHCl<sub>3</sub>), to afford monodispersed activated MPEG7-C16 **VI** as a clear oil (370 mg, 62%).

**9.5 Synthesis of PEG Modifying Moiety (carbonic acid 2,5-dioxo-pyrrolidin-1-yl ester 2-methoxy-ethyl ester)**

[199] Monodispersed branched MPEG1 **I** (200 mg, 2.63 mmol) was dissolved in acetonitrile (20 mL) and disuccinimidyl carbonate (DSC, **II**, 1.00 g, 3.94 mmol) was added. Then triethylamine (0.399 g, 3.94 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~16h, the crude reaction was evaporated to dryness and then dissolved in sat. NaHCO<sub>3</sub> (20 mL), washed ethyl acetate (2 x 50 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, EtOAc/MeOH, 10:1) afforded the solid **III** (0.346 g, 60% yield). ESI MS: *m/e* 218.09 (M+H)<sup>+</sup>.

5 **9.6 Synthesis of Hydrolysable Micropegylated Modifying Moiety (hexanoic acid 2-(2,5-dioxo-pyrrolidin-1-yl)oxyacetate)**

[200] Monodispersed branched C6-PEG1 **I** (100 mg, 0.625 mmol) was dissolved in acetonitrile (10 mL) and disuccinimidyl carbonate (DSC, **II**, 0.240 g, 0.936 mmol) was added. Then triethylamine (0.095 g, 0.936 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~16h, the crude reaction was evaporated to dryness and then dissolved in sat. NaHCO<sub>3</sub> (10 mL), washed ethyl acetate (2 x 20 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, EtOAc/MeOH, 10:1) afforded an off-white solid **III** (0.146 g, 78% yield). ESI MS: *m/e* 302.29 (M+H)<sup>+</sup>.

**9.7 Synthesis of Linear mPEG Modifying Moiety (carbonic acid 2,5-dioxo-pyrrolidin-1-yl ester 2-(2-methoxy-ethoxy)-ethyl ester)**

[201] Monodispersed branched MPEG2 **I** (470 mg, 3.91 mmol) was dissolved in acetonitrile (20 mL) and disuccinimidyl carbonate (DSC, **II**, 1.50 g, 5.87 mmol) was added. Then triethylamine (0.594 g, 5.87 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~16h, the crude reaction was evaporated to dryness and then dissolved in sat. NaHCO<sub>3</sub> (20 mL), washed ethyl acetate (2 x 50 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, EtOAc/MeOH, 10:1) afforded the solid **III** (0.632 g, 62% yield). ESI MS: *m/e* 262.23 (M+H)<sup>+</sup>.

**9.8 Synthesis of Hydrolysable Micropegylated Modifying Moiety (dodecanoic acid 2-[2-(2,5-dioxo-pyrrolidin-1-yloxy-carbonyloxy)-ethoxy]-ethyl ester)**

[202] Monodispersed branched C12-PEG2 **I** (200 mg, 0.69 mmol) was dissolved in acetonitrile (10 mL) and disuccinimidyl carbonate (DSC, **II**, 0.265 g, 1.035 mmol) was added. Then triethylamine (0.104 g, 1.035 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~16h, the crude reaction was evaporated to dryness and then dissolved in sat. NaHCO<sub>3</sub> (10 mL), washed ethyl acetate (2 x 20 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, EtOAc/MeOH, 10:1) afforded the oil **III** (0.247 g, 83% yield). ESI MS: *m/e* 430.50(M+H)<sup>+</sup>.

**9.9 Synthesis Linear PEG Modifying Moiety (carbonic acid 2,5-dioxo-pyrrolidin-1-yl ester 2-[2-(2-methoxy-ethoxy)-ethoxy]-ethyl ester)**

[203] Monodispersed branched MPEG3 **I** (200 mg, 1.21 mmol) was dissolved in acetonitrile (20 mL) and disuccinimidyl carbonate (DSC, **II**, 0.468 g, 1.82 mmol) was added. Then triethylamine (0.184g, 1.82 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~16h, the crude reaction was evaporated to dryness and then dissolved in sat. NaHCO<sub>3</sub> (20 mL), washed ethyl acetate (2 x 50 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, EtOAc/MeOH, 10:1) afforded the solid **III** (0.206 g, 55% yield). ESI MS: *m/e* 306.11 (M+H)<sup>+</sup>.

**9.10 Synthesis of Hydrolysable Micropegylated Modifying Moiety (hexanoic acid 2-{2-[2-(2,5-dioxo-pyrrolidin-1-yloxy-carbonyloxy)-ethoxy]-ethoxy}-ethyl ester)**

[204] Monodispersed branched C6-PEG3 **I** (200 mg, 0.80 mmol) was dissolved in acetonitrile (20 mL) and disuccinimidyl carbonate (DSC, **II**, 0.309 g, 1.209 mmol) was added. Then triethylamine (0.122 g, 1.209 mmol) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~16h, the crude reaction was evaporated to dryness and then dissolved in sat. NaHCO<sub>3</sub> (10 mL), washed ethyl acetate (2 x 20 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, EtOAc/MeOH, 10:1) afforded the oil **III** (0.203 g, 64% yield). ESI MS: *m/e* 390.40 (M+H)<sup>+</sup>.

**9.11 Synthesis of Benzyl Elimination Hydrolysable Oligomer (6-{2-[2-(2-{2-[2-(2-Methoxy-ethoxy)-ethoxy]-ethoxy}-ethoxy)-ethoxy]-ethoxy}-hexanoic acid 4-(4-nitro-phenoxy-carbonyloxymethyl)-phenyl ester)**

[205] Potassium *tert*-butoxide (3.64 g, 32.4 mmol) was dissolved in 250 mL THF. MPEG<sub>6</sub> alcohol (9.58 g, 32.3 mmol) in 10 mL THF was added. The solution was stirred for two hours. The mesylate (7.0 g, 29.4 mmol) prepared from commercially available ethyl 6-hydroxy-hexanoate was dissolved in 15 mL THF and added to the PEG solution. The reaction was stirred at room temperature overnight. The reaction was quenched with 25 mL MeOH and filtered through a short pad of Celite. The filtrate was concentrated in vacuo and the residue purified by flash chromatography (EtOAc/2 % MeOH) to give 3.19 g (25 %) of **I**. ESI MS: *m/e* 461.07 (M+Na)<sup>+</sup>.

[206] To hydrolyze the ethyl ester, 1.1 g (2.51 mmol) of **I** was treated with 35 mL 1 N NaOH. After six hours, the initially cloudy mixture had become a clear, yellow-colored solution. The mixture was saturated

with NaCl and acidified with concentrated HCl until the pH was 2. The solution was extracted with 100 mL CH<sub>2</sub>Cl<sub>2</sub>. The organics were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated in vacuo to afford 0.80 g (78 %) of the carboxylic acid **II**. ESI MS: *m/e* 411.07 (M+H)<sup>+</sup>, 433.10 (M+Na)<sup>+</sup>.

[207] Carboxylic acid **III** (0.80 g, 1.95 mmol) was dissolved in 16 mL CH<sub>2</sub>Cl<sub>2</sub> and placed under N<sub>2</sub>. To the solution, 0.486 g (2.5 mmol) EDC and 0.288 g (2.5 mmol) N-hydroxysuccinimide (NHS) were added. After five hours, another 0.2 g EDC and 0.12 g NHS were added to drive reaction to completion. When TLC indicated that no unreacted carboxylic acid remained, the mixture was diluted with 60 mL CH<sub>2</sub>Cl<sub>2</sub> and washed with cold 1 N HCl (1 x 100 mL), cold water (2 x 100 mL) and brine (3 x 100 mL). The organics were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated in vacuo to yield 0.71 g (71 %) of **III**. ESI MS: *m/e* 508.17 (M+H)<sup>+</sup>, 530.07 (M+Na)<sup>+</sup>.

[208] In 120 mL dry CH<sub>2</sub>Cl<sub>2</sub>, 4-hydroxybenzyl alcohol (2.93 g, 3.6 mmol) and 2.98 g (24.4 mmol) DMAP were dissolved. Compound **III** (1.2 g, 2.37 mmol) was dissolved in another 40 mL CH<sub>2</sub>Cl<sub>2</sub> and added. The reaction was stirred at room temperature overnight. The mixture was washed with 1 N HCl (2 x 200 mL) and brine (2 x 200 mL). The organics were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness. The residue was purified *via* flash chromatography (silica, EtOAc/10 % MeOH) to give 0.701 g (58 %) of oligomer **IV**. ESI MS: 539.10 *m/e* (M+Na)<sup>+</sup>.

[209] The oligomer **IV** (0.562 g, 1.09 mmol) was dissolved in 15 mL dry CH<sub>2</sub>Cl<sub>2</sub>. To this solution was added 0.23 mL (1.64 mmol) TEA and 0.329 g (1.64 mmol) *p*-nitro-phenylchloroformate. The reaction was stirred overnight at room temperature. The mixture was then diluted with a further 15 mL CH<sub>2</sub>Cl<sub>2</sub> and washed with 15 mL 1 N HCl followed by 15 mL water. The organics were dried over MgSO<sub>4</sub>, filtered and concentrated to dryness. The crude product was purified *via* flash chromatography (silica, gradient elution: 3/1 EtOAc/hexanes – EtOAc) to give 504 mg (74 %) of the activated oligomer. ESI MS: *m/e* 682.72 (M+H)<sup>+</sup>, 704.72 (M+Na)<sup>+</sup>.

5 **9.12 Synthesis of Aryl Carbamate Hydrolysable Modifying Moiety (carbonic acid 4-(6-{2-[2-(2-{2-[2-(2-methoxy-ethoxy)-ethoxy]-ethoxy}-ethoxy)-ethoxy]-ethoxy}-hexyloxy)-phenyl ester 4-nitro-phenyl ester)**

[210] MPEG<sub>6</sub> alcohol (10.0 g, 33.7 mmol) was dissolved in 40 mL dry CH<sub>2</sub>Cl<sub>2</sub> and the resulting solution was cooled to 0 °C in an ice bath. TEA (5.64 mL, 40.5 mmol) was added and then 3.13 mL (40.5 mmol) methanesulfonyl chloride was added drop wise. The reaction was stirred for thirty minutes at 0 °C and then removed from the ice bath, allowed to come to room temperature and stirred overnight. The reaction mixture was diluted with more CH<sub>2</sub>Cl<sub>2</sub> and washed with saturated NaHCO<sub>3</sub> and water. The organics were dried over MgSO<sub>4</sub>, filtered and concentrated *in vacuo* to afford 12.4 g (98 %) of MPEG<sub>6</sub> mesylate, **I**.

[211] A solution of 1,6-hexanediol was prepared from 6.311 g of the diol (53.41 mmol) and 180 mL of dry THF. The solution was cooled to 0 °C and placed under a N<sub>2</sub> atmosphere. Potassium *tert*-butoxide (5.996 g, 53.41 mmol) was added to the solution and the resulting mixture was stirred for one hour. **I** (10.0 g, 26.7 mmol) in 30 mL THF was added to the mixture. All was stirred for a further 30 minutes at 0 °C, then allowed to warm to room temperature and stirred overnight. The reaction mixture was filtered through Celite. The Celite was rinsed with CH<sub>2</sub>Cl<sub>2</sub> and the combined filtrate was concentrated *in vacuo*. The residue was redissolved in CH<sub>2</sub>Cl<sub>2</sub> and washed with water. The organics were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and evaporated to dryness. Purification by flash chromatography (silica, CHCl<sub>3</sub>/10 % MeOH). Some material was further purified by preparatory TLC (EtOAc/10 % MeOH). Combined yield was 3.923 g (37 %) of **II**.

[212] **II** (3.923 g, 9.89 mmol) was dissolved in 16 mL dry  $\text{CH}_2\text{Cl}_2$  and the resulting solution was cooled to 0 °C and placed under  $\text{N}_2$ . Triethylamine (1.65 mL, 11.9 mmol) was added and then 0.92 mL (11.9 mmol) methanesulfonyl chloride was added dropwise. The reaction was stirred at 0 °C for a further thirty minutes and then allowed to come to room temperature and stirred overnight. The reaction mixture was diluted with more  $\text{CH}_2\text{Cl}_2$  and washed with saturated  $\text{NaHCO}_3$  and water. The organics were dried over  $\text{Mg}_2\text{SO}_4$ , filtered and concentrated *in vacuo* to provide 4.25 g (91 %) of mesylate **III**.

[213] In a flask containing 50 mL dry THF, 5.001g (24.97 mmol) of 4-benzyloxyphenol was dissolved. Potassium *tert*-butoxide (1.202 g, 9.989 mmol) was added and the resulting mixture was stirred for one hour at room temperature under an inert atmosphere. A solution of 3.950 g (8.324 mmol) of **III** in 20 mL THF was added. After a further 18 hours, the entire mixture was quenched with 10 mL MeOH and filtered through a short pad of Celite. The filtrate was concentrated in vacuo and the residue purified by flash chromatography (silica, EtOAc/MeOH 20:1) to provide 1.584 g (33 %) of compound **IV**. ESI MS: *m/e* 579.16 ( $\text{M}+\text{H}$ )<sup>+</sup>, 601.14 ( $\text{M}+\text{Na}$ )<sup>+</sup>.

[214] Compound **IV** (0.683 g, 1.18 mmol) was dissolved in 20 mL MeOH. To this solution was added a slurry of 136 mg of 5 % Pd/C in MeOH. The entire mixture was placed under  $\text{H}_2$  and stirred until TLC confirmed that all of the starting material had been consumed. The mixture was then filtered through Celite and the filtrate was evaporated to dryness to yield 412 mg (71 %) of **V**. ESI MS: *m/e* 511.09 ( $\text{M}+\text{Na}$ )<sup>+</sup>.

[215] The oligomer **V** (0.605 g, 1.09 mmol) was dissolved in 15 mL dry  $\text{CH}_2\text{Cl}_2$ . To this solution was added 0.23 mL (1.64 mmol) TEA and 0.329 g (1.64 mmol) *p*-nitro-phenylchloroformate. The reaction was stirred overnight at room temperature. The mixture was then diluted with a further 15 mL  $\text{CH}_2\text{Cl}_2$  and washed with 15 mL 1 N HCl followed by 15 mL water. The organics were dried over  $\text{MgSO}_4$ , filtered and concentrated to dryness. The crude product was purified via flash chromatography (silica, gradient elution: 3/1 EtOAc/hexanes – EtOAc) to give 491 mg (75 %) of the activated oligomer. ESI MS: *m/e* 654.71 ( $\text{M}+\text{H}$ )<sup>+</sup>, 675.71 ( $\text{M}+\text{Na}$ )<sup>+</sup>.

### 9.13 Methods For Activating Oligomeric Moieties

[216] The present example describes methods by which a oligomeric moiety of the present invention may be activated.

### 9.13.1 Method I - Activation Using DSC

[217] Alkyl-PEG-OH, **I** (0.4 mmol, 1 eq.) was dissolved in acetonitrile (5 mL) and disuccinimidyl carbonate (DSC, 0.6 mmol, 1.5 eq.) was added. Then triethylamine (1.2 mmol, 1.5 eq.) was added dropwise and after 10 min the reaction mixture became clear. Reaction was stirred overnight at RT. After stirring for ~16h, the crude reaction was evaporated to dryness and then dissolved in sat. NaHCO<sub>3</sub> (10 mL), washed ethyl acetate (2 x 20 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, EtOAc/MeOH, 10:1) afforded the activated oligomer **II**.

### 9.13.2 METHOD II: Activation Using NHS

- 5 [218] MPEG-alkyl-acid **I** (0.544 mmol, 1.0 eq.) was dissolved in 15 ml of anhydrous methylene chloride and then solution of N-hydroxysuccinimide (0.816 mmol, 1.5 eq.) and 1-ethyl-3-(3'-dimethylaminopropyl) carbodiimide. HCl (EDCI-HCl, 0.816 mmol, 1.5 eq.) in anhydrous methylene chloride added. Reaction was stirred for several hours, then washed with 1N HCl, water, dried over MgSO<sub>4</sub>, filtered and concentrated. Crude material was purified by flash chromatography (silica, gradient elution: 2-5 % methanol in CHCl<sub>3</sub>), to
- 10 afford activated MPEG-alkyl-acid **II**.

### 9.14 Synthesis of Modifying Moiety with Branched PEG (6-[2-(2-{2-[2-(2-Methoxy-ethoxy)-ethoxy]-ethoxy}-ethoxy)-1-(2-{2-[2-(2-methoxy-ethoxy)-ethoxy]-ethoxy}-ethoxymethyl)-ethoxycarbonylamino]-hexanoic acid 2,5-dioxo-pyrrolidin-1-yl ester)

1. Tetraethylene glycol monomethyl ether (14.0 g, 67 mmol) was dissolved in tetrahydrofuran (90 mL) and NaH (1.77 g, 74 mmol) was added portion wise and reaction was stirred for 2 h. Then

epichlorohydrin (26.3 mL, 0.34 mol) was added dropwise and the reaction was stirred at RT for 48 h. The crude reaction mixture was filtered through Celite and washed  $\text{CH}_2\text{Cl}_2$  (250 mL). The filtrate was washed  $\text{H}_2\text{O}$  (2 x 250 mL), dried  $\text{MgSO}_4$ , and evaporated to dryness. Column chromatography (silica, ethyl acetate) afforded **1** a clear oil (10.15 g, 57% yield).

5

**2.** Tetraethylene glycol monomethyl ether (7.96g, 0.038 mol) and **1** (10.1, 0.038 mol) were dissolved in  $\text{CH}_2\text{Cl}_2$  (100 mL) and  $\text{BF}_3 \cdot \text{OEt}_2$  (0.48 mL, 0.0038 mol) was added. The reaction was stirred overnight at RT. Crude reaction was diluted with  $\text{CH}_2\text{Cl}_2$  (200 mL), washed sat.  $\text{NaHCO}_3$  (300 mL),  $\text{H}_2\text{O}$  (300 mL), dried  $\text{MgSO}_4$ , and evaporated to dryness. Column chromatography (silica, ethyl acetate / MeOH, 10:1) afforded **2** a clear oil (4.5 g, 25% yield).

10

15

**3.** 4-Nitrochloroformate (2.87 g, 14.3 mmol) and **2** (4.5 g, 9.5 mmol) were dissolved in  $\text{CH}_2\text{Cl}_2$  (45 mL). After stirring for 10 min, TEA (2.1 mL, 15 mmol) was added and reaction stirred overnight at RT. Crude reaction was diluted with  $\text{CH}_2\text{Cl}_2$  (130 mL), washed 1M HCl (175 mL),  $\text{H}_2\text{O}$  (175 mL), dried  $\text{MgSO}_4$ , and evaporated to dryness. Column chromatography (silica, ethyl acetate / MeOH, 15:1) afforded **3** a yellowish oil (2.38 g, 40% yield).

20

**4.** 6-Aminocaproic acid (0.126 g, 0.96 mmol) and  $\text{K}_2\text{CO}_3$  (0.221 g, 1.6 mmol) were dissolved in  $\text{H}_2\text{O}$  (DI, 5 mL). Then **3** (0.5 g, 0.8 mmol) was dissolved in THF (0.7 mL) and added dropwise. The reaction was stirred overnight at RT. Crude reaction was diluted with  $\text{H}_2\text{O}$  (20 mL), acidified to pH ~ 1 with HCl, washed  $\text{CH}_2\text{Cl}_2$  (2 x 25 mL), organic layers dried  $\text{MgSO}_4$ , and evaporated to dryness. Column chromatography (silica,  $\text{CHCl}_3$  / MeOH, 15:1) afforded **4** a clear oil (0.428 g, 85% yield)

25

5. Activated using **Method II**: **4** (0.40 g, 0.64 mmol), N-hydroxysuccinimide (0.088 g, 0.77 mmol), EDCI (0.160 g, 0.83 mmol), and CH<sub>2</sub>Cl<sub>2</sub> (5 mL). Column chromatography (silica, ethyl acetate / MeOH, 10:1) afforded **5** a clear oil (0.320 g, 69% yield).

**9.15 Synthesis of Linear PEG-Alkyl Modifying Moiety (Carbonic acid 2,5-dioxo-pyrrolidin-1-yl ester 2-{2-[2-(2-{2-[2-(2-hexyloxy-ethoxy)-ethoxy]-ethoxy}-ethoxy)-ethoxy]-ethoxy}-ethyl ester)**

1. Triethylene glycol (30 g, 0.2 mol) was dissolved in a solution of NaOH (8 g in 8 mL of H<sub>2</sub>O) and stirred for 10 min. Then benzyl chloride (7 mL, 0.062 mol) was added and the reaction mixture was heated to 100 °C and stirred overnight. The crude reaction was diluted with sat NaCl (500 mL), washed CH<sub>2</sub>Cl<sub>2</sub> (2 x 400 mL), organic layers dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate to ethyl acetate / MeOH, 10:1) afforded **1** a yellowish oil (9.87 g, 67% yield).

2. To a solution of **1** (9.87 g, 0.041 mol) in CH<sub>2</sub>Cl<sub>2</sub> (50 mL) was added TEA (7.1 mL, 0.054 mol). The solution was then cooled to 0 °C in an ice bath and then methanesulphonyl chloride (3.9 mL, 0.049 mol) dissolved in CH<sub>2</sub>Cl<sub>2</sub> (10 mL) was added dropwise. The reaction was stirred at 0 °C for 0.5 h and then at RT for 4 hours. The crude reaction was filtered through Celite, washed CH<sub>2</sub>Cl<sub>2</sub> (100 mL), filtrate washed with sat NaHCO<sub>3</sub> (150 mL), H<sub>2</sub>O (150 mL), dried MgSO<sub>4</sub>, and evaporated to dryness to afford **2** a yellow oil (11.06 g, 85% yield).

3. Tetraethylene glycol (7.32 g, 0.038 mol) was dissolved in tetrahydrofuran (140 mL) and NaH was added portion wise over 0.5 h and the reaction was stirred for an additional 1 h. Then **2** (6.0 g, 0.019 mol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (20 mL) and added dropwise and the reaction was stirred overnight at RT. Crude

reaction was filtered through Celite, washed  $\text{CH}_2\text{Cl}_2$ , and evaporated to dryness. The resultant oil was dissolved in  $\text{CH}_2\text{Cl}_2$  (150 ml), washed  $\text{H}_2\text{O}$  (150 mL), sat.  $\text{NaHCO}_3$  (150 mL),  $\text{H}_2\text{O}$  (150 mL), dried  $\text{MgSO}_4$ , and evaporated to dryness. Column chromatography (silica, ethyl acetate / MeOH, 10:1) afforded **3** yellowish oil (3.83 g, 49% yield).

4. Prepared in the same manner as **2**: hexanol (6.2 mL, 0.05 mol), methanesulphonyl chloride (4.6 mL, 0.058 mol), TEA (8.6 mL, 0.065 mol), and  $\text{CH}_2\text{Cl}_2$  (60 mL) afforded **4** a yellow oil (7.8 g, 86% yield).

5. To a solution of **3** (5.45 g, 0.13 mol) in tetrahydrofuran (160 mL) was added potassium tert-butoxide (1.60 g, 0.0144 mol) and the reaction was stirred for 1.5 h. Then **4** (2.59 g, 0.0144 mol) dissolved in tetrahydrofuran (20 mL) was added dropwise and the reaction was stirred overnight. The crude reaction was filtered through Celite, washed  $\text{CH}_2\text{Cl}_2$ , and evaporated to dryness. The resultant oil was dissolved in ethyl acetate (150 mL), washed  $\text{H}_2\text{O}$  (2 x 150 mL), dried  $\text{MgSO}_4$ , and evaporated to dryness. Column chromatography (silica, ethyl acetate) afforded **5** a yellowish oil (2.40 g, 36% yield).

6. To a solution of **5** (2.4 g, 4.8 mmol) in ethyl acetate (16 mL) was added palladium on activated carbon 10 wt% (1.0 g) and the reaction vessel sealed with a septum. A balloon containing  $\text{H}_2$  was then inserted in the septum via needle and the reaction was stirred overnight at RT. Crude reaction mixture was filtered through Celite, washed ethyl acetate, and evaporated to dryness to afford **6** a clear oil (1.61 g, 82% yield).

30 7. A phosgene solution (15 mL of a 20% phosgene in toluene) was cooled to  $-10\text{ }^\circ\text{C}$  and **6** (1.60 g, 3.9 mmol) dissolved in toluene (5 mL) was added dropwise. The reaction was stirred at  $-10\text{ }^\circ\text{C}$  for 0.5 h and

then 4 h at RT. The phosgene and toluene was then distilled off and the resultant oil was dried under vacuum to afford **7** a yellowish oil.

**8**

**8.** Activated using **Method II:** **7** (1.65 g, 0.79 mmol), N-hydroxysuccinimide (0.437 g, 3.8 mmol), TEA (2.7 mL, 3.8 mmol), and CH<sub>2</sub>Cl<sub>2</sub> (10 mL). Column chromatography (silica, ethyl acetate / MeOH, 15:1) afforded **8** a clear oil (1.06 g, 57% yield).

**9.16 Synthesis Branched Alkyl-PEG-Alkyl (6-[2-(2-[2-(2-(2-Heptyloxy-ethoxy)-ethoxy]-ethoxy)-ethoxy]-1-(2-{2-[2-(2-heptyloxy-ethoxy)-ethoxy]-ethoxy}-ethoxymethyl)-ethoxycarbonylamino]-hexanoic acid 2,5-dioxo-pyrrolidin-1-yl ester)**

**1**

**1.** Prepared in the same manner as shown in Example 9.15: hexanol (18 mL, 0.15 mol), methanesulphonyl chloride (12.3 mL, 0.16 mol), TEA (25 mL, 0.18 mol), and CH<sub>2</sub>Cl<sub>2</sub> (180 mL) afforded **1** a yellow oil (23.1 g, 85% yield).

**2**

**2.** Tetraethylene glycol (50.5 g, 0.26 mol) was dissolved in tetrahydrofuran (350 mL) and potassium *tert*-butoxide (29.2 g, 0.26 mol) was added portion wise over 0.5 h. The reaction was stirred an additional 1h and then **1** (23.0 g, 0.13 mol) dissolved in THF (50 mL) was added. The reaction was stirred overnight at RT. The crude reaction was filtered through Celite, washed CH<sub>2</sub>Cl<sub>2</sub>, and evaporated to dryness. The resultant oil was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (300 mL), washed H<sub>2</sub>O (2 x 300 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate) afforded **2** a clear oil (18.51 g, 51% yield).

**3**

3. To a solution of **2** (10.0 g, 36 mmol) in tetrahydrofuran (60 mL) was added NaH (0.95 g, 40 mmol) portion wise and reaction was stirred for 0.5 h. Then epichlorohydrin (14.1 mL, 0.34 mol) was added dropwise and the reaction was stirred at RT for 48 h. The crude reaction mixture was filtered through Celite, washed CH<sub>2</sub>Cl<sub>2</sub>, and evaporated to dryness. The resultant oil was dissolved  
 5 CH<sub>2</sub>Cl<sub>2</sub> (200 mL), washed sat. NaCl (200 mL), sat. NaHCO<sub>3</sub> (200 mL), H<sub>2</sub>O (200 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate / hexanes, 10:1) afforded **3** a clear oil (5.46 g, 45% yield).

4

- 10 4. To a solution of **2** (4.54 g, 16 mmol) and **3** (5.46, 16 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (50 mL) was added BF<sub>3</sub>·OEt<sub>2</sub> (0.48 mL, 0.0038 mol). The reaction was stirred overnight at RT. Crude reaction was diluted with CH<sub>2</sub>Cl<sub>2</sub> (50 mL), washed sat. NaHCO<sub>3</sub> (100 mL), H<sub>2</sub>O (100 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate to ethyl acetate / MeOH, 10:1) afforded **4** a clear oil (2.40 g, 24%  
 15 yield).

5

5. 4-nitrochloroformate (1.18 g, 5.8 mmol) and **4** (2.4 g, 3.9 mmol) were dissolved in CH<sub>2</sub>Cl<sub>2</sub> (25 mL).  
 20 After stirring for 10 min, TEA (0.89 mL, 6.4 mmol) was added and reaction stirred overnight at RT. Crude reaction was diluted with CH<sub>2</sub>Cl<sub>2</sub> (75 mL), washed 1M HCl (100 mL), H<sub>2</sub>O (100 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate) afforded **5** a yellowish oil (1.04 g, 34% yield).

6

- 25 6. 6-Aminocaproic acid (0.157 g, 1.2 mmol) and K<sub>2</sub>CO<sub>3</sub> (0.276 g, 2.0 mmol) were dissolved in H<sub>2</sub>O (DI, 8 mL). Then **5** (0.80 g, 1.0 mmol) was dissolved in THF (1.0 mL) and added dropwise. Oil droplets formed

when 3 was added and ethanol (2 mL) was added and the reaction was stirred overnight at RT. Crude reaction was diluted with H<sub>2</sub>O (30 mL), acidified to pH ~ 1 with HCl, washed CH<sub>2</sub>Cl<sub>2</sub> (2 x 35 mL), organic layers dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate / MeOH, 20:1) afforded 6 a clear oil (0.720 g, 46% yield)

5

7. Activated using **Method II**: 6 (0.356 g, 0.46 mmol), N-hydroxysuccinimide (0.063 g, 0.55 mmol), EDCI (0.115 g, 0.6 mmol), and CH<sub>2</sub>Cl<sub>2</sub> (3 mL). Column chromatography (silica, ethyl acetate) afforded 7 a clear oil (0.180 g, 45% yield).

10

**9.17 Synthesis of Sugar-PEG-Alkyl Modifying Moiety 2,2-Dimethyl-propionic acid 4,5-bis-(2,2-dimethyl-propionyloxy)-6-(2,2-dimethyl-propionyloxymethyl)-3-{6-[2-(2-{2-[2-(2,5-dioxo-pyrrolidin-1-yloxy-carbonyloxy)-ethoxy]-ethoxy}-ethoxy)-ethoxy]-hexanoylamino}-tetrahydro-pyran-2-yl ester)**

15

1. Prepared in the same manner as shown in Example 9.15: Ethyl 6-hydroxyhexanoate (8.0 g, 0.05 mol), methanesulphonyl chloride (4.6 mL, 0.06 mol), TEA (10 mL, 0.072 mol), and CH<sub>2</sub>Cl<sub>2</sub> (32 mL) afforded 1 a yellow oil (11.15 g, 93% yield).

20

25

2. Tetraethylene glycol (19.1 g, 0.098 mol) was dissolved in tetrahydrofuran (190 mL) and NaH (1.69 g, 0.071 mol) was added portion wise over 0.5 h. The reaction was stirred an additional 1h and then 1 (23.0 g, 0.13 mol) dissolved in tetrahydrofuran (10 mL) was added. The reaction was stirred overnight at RT. The crude reaction was filtered through Celite, washed CH<sub>2</sub>Cl<sub>2</sub>, and evaporated to dryness. The resultant oil was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (200 mL), washed sat. NaCl (200 mL), H<sub>2</sub>O (200 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate / MeOH, 25:1) afforded 2 a clear oil (1.60 g, 10% yield).

30

3. A solution of 2 (1.60 g, 4.7 mmol) in 1 M NaOH (6 mL) was stirred for 2 h at RT. The crude reaction was diluted with sat. NaCl (24 mL), acidified to pH ~ 2, washed CH<sub>2</sub>Cl<sub>2</sub> (2 x 30 mL), dried MgSO<sub>4</sub>, and evaporated to dryness to afford 3 a clear oil (1.08 g, 73% yield).

4. 2,3,4,6-*Tetra*-O-pivaloyl- $\beta$ -D-galactospyranosylamine (0.836 g, 1.6 mmol) and 3 (0.50 g, 1.6 mmol) were dissolved in CH<sub>2</sub>Cl<sub>2</sub> (8 mL). Then EDCI (0.368 g, 1.92 mmol) was added and the reaction was stirred overnight at RT. After stirring overnight, reaction was incomplete so EDCI (0.368 g, 1.92 mmol) was added and the reaction was stirred overnight at RT. Crude reaction was diluted with CH<sub>2</sub>Cl<sub>2</sub> (22 mL), washed 1 M HCl (30mL), H<sub>2</sub>O (30 mL), sat. NaCl (30 mL), dried MgSO<sub>4</sub>, and evaporated to dryness. Column chromatography (silica, ethyl acetate / MeOH) afforded 4 a viscous oil (0.397 g, 31% yield).

5. Activated using **Method I**: 4 (0.397 g, 0.50 mmol), N-hydroxysuccinimide (0.063 g, 0.60 mmol), TEA (0.10 mL, 0.75 mmol), and acetonitrile (4 mL). Column chromatography (silica, ethyl acetate) afforded 5 a viscous oil (0.256 g, 56% yield).

### 9.18 Hydrolyzable, Non-hydrolyzable and Pegylated Natriuretic Conjugates

[219] The present example is provided to demonstrate the utility of the present invention for providing natriuretic compound conjugates that have been modified to include virtually all classes of oligomeric moieties, particularly non-hydrolyzed oligomers, micropegylated oligomers, and hydrolyzable oligomers.

5 [220] The present hBNP conjugates were synthesized utilizing various oligomers conjugated at different positions on the peptide. The conjugates having the best combination of traits (agonist activity at the receptor, resistance to proteolysis, and oral bioavailability) have become the lead candidates for more extensive *in vivo* testing.

10 [221] The native hBNP was obtained from a contract peptide synthesis company. The amphiphilic oligomers that were used in the conjugation came from a supply of oligomers and from oligomers designed and synthesized specifically for conjugation to hBNP. The conjugation followed a three-tiered conjugation strategy as illustrated in Figure 2. Class 1 oligomers were tested first. Because extensive conjugation with Class 1 oligomers lessened activity, tri and tetra conjugates with Class 2 oligomers were investigated. Because Class 2 oligomers were not as  
15 efficacious, two pro-drug conjugates (Class 3 oligomers) were evaluated.

[222] A first class of conjugates is non-hydrolysable. For conjugates of this class, the drug substance that is dosed (i.e., the conjugate) is the substance that acts at the receptor. In other words, the oligomer and its attachment to the peptide remain intact from the time of dosing to the time of clearance. These oligomers may generally be comprised of an alkyl portion and a PEG portion. To maximize the effectiveness of the  
20 oligomer to make the conjugate orally available and resistant to proteolysis, the lengths of the alkyl and PEG portions can be altered and the order can be switched. The extent of conjugation (e.g. mono-, diconjugate) can also be manipulated. Some oligomers that can provide conjugates falling within this first class as well as methods for providing such conjugates are described in U.S. Patent No. 5,359,030 to Ekwuribe; U.S. Patent No. 5,438,040 to Ekwuribe; U.S. Patent No. 5,681,811 to Ekwuribe; U.S. Patent No. 6,191,105 to  
25 Ekwuribe; U.S. Application No. 09/474,915, filed December 31, 1999; U.S. Application No. 09/459,443, filed December 13, 1999; and U.S. Application No. 09/873,797, filed June 4, 2001, the disclosures of which are incorporated by reference herein in their entireties.

[223] A second class of conjugates are micropegylated. For conjugates of this class, the alkyl portion of the oligomer is cleaved once the conjugate is in the bloodstream. These conjugates may be particularly  
30 useful when conjugation occurs within a region of the natriuretic peptide that is necessary for binding to receptor, NPR-A. In such cases, the first class of oligomers may be beneficial to stability and delivery, but may be detrimental to activity. The second class of conjugates reduces or eliminates that problem. The amphiphilic oligomer remains intact through the digestive tract and enhances absorption in the upper

duodenum. Once in circulation, the alkyl portion is cleaved. Thus, a smaller oligomer is attached to the circulating peptide when it reaches the receptor. In some embodiments, the decreased steric hindrance leads to increased activity at the receptor. Some oligomers that can provide conjugates falling within this second class as well as methods for providing such conjugates are described in U.S. Patent No. 6,309,633 to Ekwuribe et al. and U.S. Application No. 10/018,879, filed December 19, 2001, the disclosures of which are incorporated by reference herein in their entireties.

[224] A third class of conjugates is fully hydrolysable. For conjugates of this class, the entire oligomer is cleaved once the conjugate is absorbed. Like the second class, these conjugates may be particularly useful when conjugation occurs within a region that is necessary for binding. However, in the event that the micropegylated conjugates still do not retain sufficient activity, the third class of conjugates may completely obviate the possibility of the oligomer interfering with receptor binding. In this case, the conjugate remains intact through the digestive tract. Once the conjugate is absorbed, the oligomer is cleaved, which releases the native peptide in circulation.

[225] *Conjugation of hBNP.* The carboxyl group of the amphiphilic oligomer (C<sub>6</sub>PEG<sub>7</sub>) is activated with N-hydroxy succinimide, a common activating group in peptide chemistry. Once activated, the oligomers are attached to the peptide either in aqueous or DMSO solution. hBNP has four sites for conjugation: three Lys residues and the N-terminus. By varying the stoichiometry of the reaction, the extent of conjugation (mono-, di-, etc.) can be controlled. Product distribution can be altered by varying the reaction conditions. As preferred sites for conjugation are discovered through the activity assays, preferential synthesis of the desired conjugates can be obtained by varying the stoichiometry and the reaction conditions.

[226] *Choice of PEG-alkyl Oligomers.* By varying the relative length of the alkane (hydrophobic) and PEG (hydrophilic) components, the amphiphilicity and solution structure of the conjugate can be improved. The PEG portion is very flexible in solution and may play an important role in resistance to enzymes. The alkyl portion may enhance absorption in the gut and/or enable interaction with cell membranes. The latter feature may be particularly important when the target is a membrane-bound protein on the cell surface, such as NPR-A. Thus, the choice of the oligomer may determine the effectiveness of the conjugate in terms of enzyme stability and oral bioavailability.

[227] *Purification of hBNP Conjugates.* The reaction mixtures are purified on a preparative HPLC column (C-18) with a solvent gradient system made of isopropanol/water (0.1% trifluoroacetic acid). The solvent is evaporated and lyophilized to give dry products. Purity of the conjugates is determined by reversed-phase HPLC and mass spectrometry.

**9.18.1 Class 1 Oligomers: Non-hydrolyzable**

[228] Over thirty conjugates that utilized non-hydrolyzable oligomers (Class 1) were synthesized. For conjugates of this class, the drug substance that is dosed is the substance that acts as the receptor. In other words, the oligomer and its attachment to the peptide remain intact from the time of dosing to the time of clearance. Peptide mapping experiments revealed the sites on hBNP to which the oligomers were attached. By changing the amount of oligomer added to the reaction, product distribution could be skewed. The predominant monoconjugate that formed was conjugated at Lys3; the predominant diconjugate had the oligomers attached at the Lys3 and Lys4. By varying the reaction conditions, the triconjugate and or tetraconjugate could be formed as the exclusive product. The triconjugate featured oligomer attachment at Lys3, Lys14, and Lys27. The tetra conjugate added a fourth attachment at the N-terminus. Initially all the available mono, di, tri, and tetra conjugates were isolated for testing activity in vitro. Based on the activity data, the Lys3 monoconjugates when using Class 1 oligomers were focused.

**9.18.2 Class 2 Oligomers: Micropegylated**

[229] Eight conjugates that utilized micropegylation (Class 2) were synthesized based on the theory that, because Lys14 and Lys27 are in (or proximal to) the binding portion of BNP, micropeg conjugation of these sites would enable the peptide to be more fully conjugated and still retain activity. The amphiphilic oligomer remains intact through the digestive tract and enhances absorption in the upper duodenum. Once in circulation, the alkyl portion is cleaved. Thus, a smaller oligomer is attached to the circulating peptide when it reaches the receptor. Tri- and tetra- conjugates of this class were synthesized both before and after cleavage of the alkyl group. Even after the alkyl groups were cleaved, small PEG units attached to BNP at three or four sites were detrimental to activity (data shown in the next section), though these conjugates retained a therapeutically significant degree of activity.

**9.18.3 Class 3 Oligomers: Hydrolyzable Oligomers**

[230] Eight conjugates that utilized fully hydrolyzable oligomers (Class 3) were synthesized. For conjugates of this class, the conjugate remains intact through the digestive tract. Once the conjugate is absorbed, the oligomer is cleaved, releasing the native peptide in circulation. Like the second class, these conjugates are useful when conjugation occurs within a region that is necessary for binding. However, in situations where the micropegylated conjugates still do not retain activity, the third class of conjugates completely obviates the possibility of the oligomer interfering with receptor binding. Mono, di, tri, and tetra conjugates were made from this class of oligomers. Tri and tetra conjugates were less stable. Two conjugates were tested.

[231] The reaction mixtures were purified on a preparative HPLC column (C18) with a solvent gradient system made of isopropanol/water (0.1% trifluoroacetic acid). The solvent was evaporated and lyophilized

to provide the conjugates was dry powders. Purities of the conjugates were determined by reverse-phase HPLC and mass spectrometry.

[232] Native BNP was examined in the assay to provide a measure of activity for the native, wild-type hBNP peptide. The native hBNP peptide used was the 1-32 amino acid sequence, SPKMQVQSGCFGRKMDRISSSSGLGCKVLRH, (SEQ ID NO: ) in which C<sup>10</sup> and C<sup>26</sup> are joined by a disulfide bond to form a bond. The results and structures of twenty-nine of the constructs are provided in Table 1. The BNP conjugates were assessed for EC<sub>50</sub> and E<sub>max</sub>, and these values were compared to those obtained under the same experimental conditions for the native peptide. These data as compared to native BNP (1-32 aa) without an oligomeric moiety are provided in Table 1. The results point to a preference for the monoconjugate BNP that included a Class 1 modifying moiety Lys3 (BNP-002), and the monoconjugate BNP that include a Class 2 modifying moiety at Lys 14 or Lys 27.

The mono-1, mono-2, mono-3 and mono-4 are the monoconjugates of BNP and labeled as in the order they elute on HPLC. In the following Table, the mono-1 BNP is the BNP peptide conjugate that includes the indicated modifying moiety (oligomer structure) at the Lys-3 BNP residue. The mono-2 and mono-3 co-elute on HPLC and its a mixture of Lys-14 and Lys-27. The diconjugates are generally obtained as a mixtures that elute closely together on HPLC. The major diconjugates are Lys3/Lys14 and Lys3/Lys27. The predominant triconjugate is conjugated at Lys3, Lys14, and Lys27. The product identified as “mono-4” includes the modifying moiety (oligomer) at the N-terminus of the BNP peptide. The “mono-1” includes the modifying moiety conjugated at Lys3 of the BNP peptide. The “mono-2” product includes the modifying moiety (oligomer) conjugated at Lys14 of the BNP peptide, or at Lys 27 of the BNP peptide.

### 9.19 Natriuretic Peptide Candidates – Urodilatin, Dendroaspis Natriuretic Peptide (DNP), and Canine Natriuretic Peptide

[233] It is anticipated that the present conjugation technology may be used with many different natriuretic peptides and analogs of these peptides to construct any number of different bioactive natriuretic peptide conjugate embodiments with retained pharmacological activity, enhanced cell-membrane permeability, and/or protease resistance. In addition to the hBNP described in several of the examples here, these candidate peptides include by way of a partial list, peptides, peptide fragments and whole peptides, and multi-constructs peptides prepared and/or isolated from the following assembly of bioequivalent peptides/proteins. It is within the scope of the present invention to include these constructs and conservative substituted constructs thereof in the preparation of the embodiments, the present invention, as well as in pharmaceutical preparations containing these constructs in a conjugated form with at least one modifying moiety as defined herein in the treatment of congestive heart failure. These peptides possess a structure amenable to modifying conjugation moiety.

#### 1. Urodilatin (hANP with four additional residues at the N-terminus)

TAPRSLRRSSCFGRMDRIGASGLGCNSFX<sup>1</sup>Y (SEQ ID NO: )

The amino acid T defines a modifying moiety conjugation site. In the above sequence, X<sup>1</sup> is lysine or an amino acid other than arginine. Where X<sup>1</sup> is lysine, a second modifying moiety conjugation site is provided.

#### 2. Canine natriuretic peptide (Canine NP)

Canine BNP offers natural advantages for manufacturing of conjugates. No conjugation sites exist in the loop region. Conjugation sites are present in the N- and C- terminal tails. These features would enable conjugation without substantial loss of activity. It should also lead to a smaller distribution of products, resulting in higher yield and easier purification.

#### 3. SPX<sup>1</sup>MMHX<sup>2</sup>GGCFGRRLDRIGSLSGLCNVLRX<sup>3</sup>Y (SEQ. ID. NO: )

The amino acid sites of X<sub>1</sub>, X<sub>2</sub>, and X<sub>3</sub> present modifying moiety conjugation sites. In this neutral peptide, all 3 sites of the peptide are available for conjugation with a modifying moiety. The loop region is identified at amino acid 10 (C) to amino acid 26 (C). It is envisioned that any 2 or all 3 of the amino acids at position 3, 14, or 27 may be substituted with a residue other than Lys, such as Arg.

#### 3. Dendroaspis natriuretic peptide (DNP)

EVX<sup>1</sup>YDPCFGH X<sup>2</sup>IDRINHVSN LGCPSLRDPRPNAPSTSA (SEQ ID NO. )

The amino acid site of the X<sub>1</sub> and X<sub>2</sub> are modifying moiety conjugation sites. In this example, both X<sub>1</sub> and X<sub>2</sub> are the amino acid Lys. In some embodiments, X<sup>1</sup> is Arg or X<sup>2</sup> is Arg. The N terminus is also a conjugation site. Preferably, where X<sup>1</sup> is lysine, X<sup>2</sup> is arginine (or other than lysine). Optionally, the peptide may include a further conjugation site at the N-terminus.

4. C-type natriuretic peptide (CNP)

GLSK<sup>1</sup>GCFGLK<sup>2</sup>LDRIGSMSGLGC (SEQ ID NO.: )

The amino acid site of the K<sup>1</sup> and K<sup>2</sup> are modifying moiety conjugation sites. In this example, both K<sup>1</sup> and K<sup>2</sup> are the amino acid Lys. However, analogs of the peptide may include an Arg (R) in place of Lys at either or both of these positions in the peptide. Optionally, the peptide may include a further conjugation site at the N-terminus.

5. ANP (human)(rat)(porcine)

SLRRSSCFGGRXDRIGAQSGLGCNSFRY (SEQ ID NO.: )

In this example, X is Met(M) or Ile(I), and wherein a modifying moiety conjugation site is at the N-terminus, or R is changed to K to provide a modifying moiety site.

**9.20 Agonist Activity at the Human Natriuretic Peptide Receptor A (NPR-A)**

[234] The vasorelaxant, natriuretic, and diuretic properties of BNP are ascribed to a secondary messenger, cyclic GMP (cGMP). The production of cGMP is accomplished by guanylate cyclase, an enzyme that is activated when BNP binds to the natriuretic peptide receptor A (NPR-A) on the surface of endothelial cells.

20 The ability of the conjugates with either non-hydrolyzable (Class 1) or micropegylated (Class 2) oligomers to stimulate the production of cGMP in human aortic endothelial cells (HAEC) expressing the natriuretic peptide receptor-A (NPR-A) was evaluated. For the micropegylated group, the conjugates were tested with and without the alkyl portion attached. The conjugates with fully hydrolyzable oligomers (Class 3) were not evaluated in this assay because the compound that is ultimately released in circulation is the native peptide.

25 [235] Tri- and tetra-conjugates utilizing non-hydrolyzable (Class 1) oligomers were less active. Therefore, tri- and tetra-conjugates utilizing micropegylated (Class 2) oligomers were prepared and tested. The in vitro data generated from these Class 2 oligomers is presented in **Table 2**.

[236] Table 2: In vitro activity of hBNP conjugates utilizing Class 2 oligomers.

hBNP or hBNP Conjugate	Extent of Conjugation	Average EC <sub>50</sub> (nM)	Average E <sub>max</sub> (%)
Native hBNP	None	236 (*./.) 120	100
BN-007	Tri	>10,000	<20
BN-008	Tetra	>10,000	<20
BN-010	Tetra	>10,000	<20
BN-013	Tetra	>10,000	<20
BN-014	Tri	>10,000	26.5
BN-015	Tetra	>10,000	<20
BN-016	Tetra	>10,000	24.6
BN-018	Tetra	>10,000	<20

[237] Figure 3 shows the activity curves for various Lys-3 conjugates utilizing Class 1 oligomers. The four conjugates in Table 2 demonstrates an average E<sub>max</sub> and an average EC<sub>50</sub> closest to those the activity obtained with native forms of the BNP peptide (Table 3) and were thus evaluated further in other assays.

[238] Table 3: In vitro activity of hBNP conjugates.

Compound	Average EC <sub>50</sub> (nM)	Average E <sub>max</sub> (%)	n
Native hBNP	236 (*./.) 120	100	25
BN-002	387 (*./.) 171	102	5
BN-021	355 (*./.) 140	90	5
BN-022	364 (*./.) 99	79	5
BN-024	296 (*./.) 172	87	6

[239] Primary HAEC were purchased from Clonetics for cGMP screening. Cells were plated into 12 well plates the day before the experiment. On the day of the experiment, cells were pre-incubated for 10 min at 37 °C with 0.5 mM IBMX to inhibit phosphodiesterases. Test compounds were added to the cells for an additional 60 min at 37 °C and the incubation was stopped by lysing cells to measure cGMP. An ELISA-based cGMP kit was used to measure cGMP production (CatchPoint-cyclic GMP Fluorescent Assay Kit, catalog #R8074, Molecular Devices Corp, Sunnyvale, CA). This kit measures cGMP via a competitive immunoassay in 96-well format. Cell lysates were added to the coated microplate followed by the addition of an anti-cGMP antibody and a horseradish peroxidase (HRP)-cGMP conjugate. Plates were incubated for two hours at room temperature, followed by four washes. A substrate solution was added and the fluorescent intensity of each well was quantitated. The fluorescent signal intensity decreased with increasing levels of cGMP. Native hBNP was be tested in each experiment as a positive control.

## 9.21 BNP Conjugates and Increased Resistance to Proteases

[240] The natriuretic compound that were active *in vitro* are being tested for their stability in the presence of various proteases, such as trypsin and chymotrypsin. The stability of these compounds conjugated to proteases can be determined by the half-lives of the compound conjugates in the presence of trypsin and chymotrypsin. Thus, several conjugates evaluated in these assays had a longer half-life than did native hBNP. For example, see Figure 4.

[241] Conjugates were incubated with the enzyme for 2 to 120 minutes at 37 °C. Digestions were stopped by adding a 1:1 1% trifluoroacetic acid (TFA): isopropanol quenching solution. Digestion of the hBNP conjugates were compared to the digestion of native hBNP in each experiment. The amount of parent compound remaining in each sample was quantitated by HPLC analysis.

## 9.22 BNP Conjugates and Oral Bioavailability

[242] The conjugates that were active *in vitro* were tested for their oral bioavailability in rats. The conjugates were administered to the gastrointestinal tract by oral gavage and the presence of hBNP conjugates in the bloodstream was assayed using available radioimmunoassay procedures. The antibodies for detection of hBNP are specific; cross reactivity with rat BNP is less than 1%. Consequently, cross reactivity and interference by endogenous rat BNP was not an issue.

[243] Adult, male rats weighing approximately 250 g were used for determining oral bioavailability of hBNP and hBNP conjugates. Rats were fasted overnight and tap water was provided ad libitum (except for a period of no water for 2 hours pre-dosing until 1 hour post dosing).

[244] Prior to dosing, rats were weighed and distributed throughout the dosing groups by body weight so that each dosing group weighed approximately the same. Five rats were used per time point. Conjugates were administered in a liquid fatty acid formulation at a dose of 2.5 mg/kg. Blood samples were taken at 5, 15, 30, and 60 min after dosing. Central venous blood for all dosing experiments was collected and centrifuged. Plasma samples were frozen at -80 °C for analysis.

[245] The plasma concentrations of hBNP conjugates were measured by a commercial immunoradiometric assay (IRMA) specific for the quantitative determination of human BNP in plasma (SHIONORIA™ BNP, Catalog # 127024, Shionogi & Co., Ltd, Osaka, Japan). Blood was drawn from the dosed rats into EDTA coated plastic polyethylene terephthalate (PET) blood collection tubes and centrifuged at 1600 – 2000 x g for 5 minutes in a refrigerated (2 – 8 °C) centrifuge. Samples were stored in plastic tubes at -80 °C in non-frost free freezers until analysis. 500 µL of sample were used for the IRMA. 100 µL of the sample was added to a tube with 200 µL of <sup>125</sup>I-BNP reagent and one anti-BNP antibody coated bead. Each tube was vortexed and incubated without shaking, for 18 to 22 hours at 2 to 8 °C. The tubes were then

aspirated and washed with 2.0 mL of washing solution (buffer solution + 0.05% NaN<sub>3</sub>) and then reaspirated. The wash process was repeated and the contents of the tube aspirated. The remaining radioactivity in each tube was counted by a gamma counter. The radioactivity was directly proportional to the concentration of hBNP or hBNP conjugates in the sample. In order to accurately quantify samples of hBNP conjugates and allow for differences of antibody recognition between hBNP conjugates and the native molecule, concentration was determined from a standard curve obtained for the appropriate hBNP conjugate.

[246] The four conjugates that were dosed in rats were all detectable in circulation five minutes after dosing (Figure 5). These four conjugates were BNP-002, BN-021, BN-022, and BN-024.

### 9.23 Preparation of a Diconjugate, a Monoconjugate and a Triconjugate polymer Modifications on the Peptide Structure

[247] The present example is provided to demonstrate the utility for the present invention in the creation of multi-conjugate forms of the bioactive peptide of choice. By way of example, the present description will describe a monoconjugate, a diconjugate and a triconjugate form of the human natriuretic peptide, hBNP.

#### Protocol for conjugating to hBNP:

[248] The oligomers would be attached via the same procedure used for conjugation to hBNP. One difference will be more of the activated oligomer may be added (1 – 10 equivalents; preferably 3-5 equivalents).

[249] Lysines are in the tails of the sequence. Multiple conjugation sites would presumably afford greater stability in the presence of proteases. The lack of conjugation sites within the loop is advantageous for binding at the NPR-A binding motif.

### 9.24 Synthesis of an hBNP amphiphilic polymer conjugate

By using amphiphilic oligomers of different size and chemical composition, the absorption and partitioning properties of a peptide conjugate, such as hBNP conjugate, can be altered. Conjugate screening is used to determine which of the conjugates retain the activity of the native peptide and show enhanced resistance to enzymes. The conjugates that have a desirable combination of traits (e.g., agonist activity at the receptor, resistance to proteolysis, and oral bioavailability) may become lead candidates for more extensive *in vivo* testing.

#### 9.24.1 General Procedure for Conjugation to BNP

Monoconjugate hBNP use sites Lys 3 or Lys 14, or Lys 27, or at the N-terminus of the peptide.

**Method I:** Preparation of monoconjugates

h-BNP (1 equiv) was dissolved in DMSO (1 ml / 35 mg of h-BNP). The activated oligomer (1.1 equiv) was dissolved in a minimal amount of THF and added to the solution of h-BNP in DMSO. The reaction was monitored by HPLC. Samples for HPLC monitoring were prepared by taking 50  
5  $\mu$ L of the reaction and diluting it in 500  $\mu$ L of H<sub>2</sub>O containing 0.1% TFA. Reactions were carried out for 45 min. If reactions were not immediately purified they were frozen until purification could be performed.

**Method II: Preparation of multiple conjugates**

10 h-BNP (1 equiv) was dissolved in DMSO (1 ml / 35 mg of h-BNP). Once h-BNP was dissolved, TEA (120 equiv) was added and the solution stirred for 5 min. Then the activated oligomer (2.2 equiv for diconjugate, 4 equiv for triconjugate, 5 equiv for tetraconjugate) was dissolved in a minimal amount of THF and added to the solution of h-BNP in DMSO. The reaction was  
15 monitored by HPLC. Samples for HPLC monitoring were prepared by taking 50  $\mu$ L of the reaction and diluting it in 500  $\mu$ L of H<sub>2</sub>O containing 0.1% TFA. Reactions were carried out for 45 min. If reactions were not immediately purified they were frozen until purification could be performed.

Diconjugate hBNP use sites Lys 3, and Lys 14, or Lys 3 and Lys 27 site on hBNP.

Triconjugate hBNP use sites Lys 3, Lys 14 and Lys 27.

**9.25 Natriuretic Compound Analogs**

20 [250] The present example is provided to demonstrate the utility of the present invention for providing a variety of forms of bioactive BNP-like peptide and peptide fragments thereof for use in the practice of the present invention. These variant forms, or analogs, are characterized by the presence of one or more  
25 mutated amino acids in place of a naturally occurring amino acid from the corresponding native peptide/protein.

1. Analog of hBNP-loop region alone

CFGRXMDRISSSSGLGC- (SEQ ID NO. 1)

wherein X is an amino acid other than Lys, or X is Arg or Gly.

2. Analog of hBNP-3Arg or an amino acid other than Lys

30 -SPRMVQSG-CFGRKMDRISSSSGLGC-X<sup>2</sup>- (SEQ ID NO. )

wherein  $X^2$  is 1 to 10 amino acids, preferably 1-6 amino acids in length. In some embodiments,  $X^2$  is KVLRRH, KVLRR, KVLRL, KVL, KV, K, RVLRRH, RVLRR, RVLRL, RVL, RV, or R.

3. Analog of hBNP-3 mutation sites; 3Arg, 14Arg, 27Arg

SPX<sup>1</sup>MVQGSQ-CFGRX<sup>2</sup>MDRISSSSGLGC-X<sup>3</sup>VLRRH (SEQ ID NO. )

5 wherein  $X^1$  is Lys or an amino acid other than Lys,  $X^2$  is an amino acid other than Lys, and  $X^3$  is Lys or an amino acid other than Lys. In some embodiments,  $X^1$ ,  $X^2$ , and  $X^3$ , are independently Arg or Gly. In other embodiments,  $X^1$  is Lys,  $X^2$  and  $X^3$  are independently Arg or Gly. In a preferred embodiment, at least one of  $X^1$ ,  $X^2$ , and  $X^3$  is Lys.

4. Analog of hBNP-14 and 27Arg, and a terminal modification site,  $X^1$ .

10 X<sup>1</sup>SPKMVQGSQ-CFGRX<sup>2</sup>MDRISSSSGLGC- X<sup>3</sup>VLRRH- (SEQ ID NO. )

Wherein  $X^1$  is a C-terminus modification site (Ser); and wherein  $X^2$  and  $X^3$  are an amino acid other than Lys. In some embodiments  $X^2$  and  $X^3$  are independently Arg or Gly. In other embodiments,  $X^2$  is Arg and  $X^3$  is Lys.

5. Analog of hBNP-14Arg

15 (All fragments in which one or both tails are shortened up to the loop)

X<sup>1</sup>---CFGRRMDRISSSSGLGC - X<sup>2</sup> (SEQ ID NO. 1)

wherein  $X^1$  is 1 to 10 amino acids, preferably 1-9 amino acids in length, and wherein  $X^2$  is 1 to 10, preferably 1-6 amino acids in length.  $X^1$  may comprise SPKMVQGSQ, PKMVQGSQ, KMVQGSQ, MVQGSQ, VQGSQ, QGSQ, GSGC, SGC, GC, C, SPK, SPKM, SPKMV, SPKMVQ, SPKMVQ, 20 KMOVQ, KMOV, KMOVQ, KMOVQS, KMOVQSG, or KMOVQSGC.  $X^2$  may comprise KVLRRH, KVLRR, KVLRL, KVL, KV, K, RVLRRH, RVLRR, RVLRL, RVL, RV, or R.

6. Analog of hBNP 1-29-3Arg or amino acids other than Lys

SP X<sup>1</sup>MVQGSQ-CFGRKMDRISSSSGLGC- KVL (SEQ ID NO. )

wherein  $X^1$  is Arg, or amino acid other than Lys

25 7. Analog of hBNP 1-26-3Arg or amino acid other than Lys

SPX<sup>1</sup>MVQGSQ-CFGRKMDRISSSSGLGC (SEQ ID NO. )

wherein  $X^1$  is Arg, Gly, or another amino acid other than Lys.

8. Analog of hBNP-shortened C-terminal tail Lys 14 Arg, 27Arg, or amino acid other than Lys

$X^1$  - CFGRMDRISSSSGLGC-RVLRRH (SEQ ID NO: )

wherein  $X^1$  is 1 to 10 amino acids, preferably 1 to 9 amino acids in length.  $X^1$  may comprise  
5 SPKMOVQSGC, PKMOVQSGC, KMOVQSGC, MVQSGC, VQSGC, QSGC, GSGC, SGC, GC, or C.

9. Analog hBNP-Lys 14Arg or an amino acid other than Lys

-CFGR  $X^1$ MDR $X^2$ GLGC- (SEQ. ID. NO. \_\_\_\_)

wherein  $X^1$  is Arg or an amino acid other than Lys, and  $X^2$  is one to four amino acids. In some  
10 embodiments,  $X^2$  is SSSS, SSS, SS, S, KSSS, KSS, or KS.

10. Analog hBNP-Arg 30 Lys or other equivalent amino acid of like charge

SPKMOVQSGCFGRKMDRISSSSGLGCKVR $X_1$ RH (SEQ ID NO. )

wherein  $X^1$  is Lys or an amino acid other than Arg.

11. Analog of hBNP-27Arg or an amino acid other than Lys

15 SPKMOVQSGCFGRKMDRISSSSGLGC  $X^1$ VLRRH (SEQ ID NO. )

wherein  $X^1$  is Arg or an amino acid other than Lys.

12. Extension Forms of hBNP

- SPKMOVQSGC-CFGRKMDRISSSSGLGC- KVLRRH -  $X^2$  (SEQ ID NO. )

$X^2$  is Lys, Cys, or Lys +  $Xaa_n$  where n is 1-100, 1-50 or 1-10, and  $Xaa$  is any amino acid, or group of amino  
20 acids independently selected, or an unknown amino acid

13. Deletion mutant analog - hBNP

-CFGR  $X^1$ MDR $X^2$ GLGC - (SEQ ID NO. )

wherein  $X^1$  is Arg or an amino acid other than Lys and wherein  $X^2$  is 1 to 4 amino acids, such as SSSS, SSS,  
SS, S, KSSS, KSS, or KS.

25 14. hBNP Analog - Receptor Specificity

SPZ<sup>1</sup>MVQGSG-CFGRZ<sup>2</sup>MDRISSSSX<sup>1</sup>X<sup>2</sup>X<sup>3</sup>C

Wherein Z<sup>1</sup> is arginine or an amino acid other than lysine, and wherein Z<sup>2</sup> is arginine or an amino acid other than lysine, wherein X<sup>1</sup> is Gly Met Leu, Phe, Ile or a conservative substitutions thereof, wherein X<sup>2</sup> is Leu, Trp, Tyr, and Phe or a conservative substitutions thereof, and wherein X<sup>3</sup> is Gly, Arg, or a conservative substitution thereof. In another embodiment of this analog, Z<sup>1</sup> is lysine and Z<sup>2</sup> is arginine or an amino acid other than lysine.

15. ANP analogs

KCFKGKNDRX<sup>1</sup>KX<sup>2</sup>QSG LX<sup>3</sup>C-NSFKY

Wherein X<sup>1</sup> is T, a, R, H, P, E;

10 Wherein X<sup>2</sup> is K, N-methyl, Arg, S, D, or P;

Wherein X<sup>3</sup> is Arg, K, Y, F, S, P, Orn, Har, Har, p-amidinophenyl Ala, I, any other amino acid that has a positive charge other than Gly, or Try

## 9.26 Recombinant Production of Native BNP and BNP Pro- Peptide and Pro-Peptide Approach to Manufacturing of BNP Conjugate

15 [251] An oral route of administration will require a large volume supply of BNP peptide. Due to the high cost and supply volume limitations associated with synthetic means to supply BNP, a recombinant technology will be preferred for preparing the conjugated BNP peptide. A recombinant technology for the supply of peptide for the production of the conjugate is described here.

### 9.26.1 Selection Of Recombinant Technology

20 [252] The goal is to select a high expression recombinant technology that is known to express small proteins (>10,000K) free of glycosylation and have the peptides secreted in soluble form for easy isolation.

25 [253] An E-coli based expression system (U.S. 5,114,923, Seilhamer et. al. is incorporated herein by reference), is used for production of bulk BNP for the approved drug Natrecor®. Use of the E-coli bacterial system is well known and well utilized in the industry for the past many decades for recombinant production of single chain proteins. The E-coli system is in general a simpler system for laboratory uses. Many new E-coli systems have been developed with high cell density to provide high yield of protein expression. However, in general, there exists a limitation to the use of an E-coli based system because of its tendency to secrete the protein in its insoluble form into an inclusion body and to be improperly folded (improper disulfide bond between cysteine amino acid residues). These limitations often leads to high cost of goods,

expensive down stream processing steps must be implemented to isolate the protein from inclusion body, and refolding the improperly folded protein to its natural state.

## 9.27 Construct of Pro-protein (pro-BNP) Sequences

[254] The natriuretic compound may also be a multi-peptide having two or more natriuretic compound units in sequence and optionally including a spacer sequence between the natriuretic compound unit, and the construct may also optionally comprise a leader and/or extensor sequence at either or both ends of the natriuretic peptide compound. For example, without limiting the multi-peptide, to any particular construct, the multi-peptide may have the following structures:

[255] NP-[NP]<sub>n</sub>;

[256] NP-[Spacer-NP]<sub>n</sub>;

[257] Leader-NP-[NP]<sub>n</sub>;

[258] Leader-NP-[Spacer-NP]<sub>n</sub>;

[259] Leader-[Spacer-NP]<sub>n</sub>;

[260] Leader-[Spacer-NP]<sub>n</sub>-Extension;

[261] Leader-NP-[Spacer-NP]<sub>n</sub>-Extension;

[262] where n may, for example be 1, 2, 3, 4, 5, 6, 7, 8, 9, 10; NP is a natriuretic peptide or natriuretic peptide analog;

[263] Spacer may, for example be an enzyme degradation site that is not present in NP (e.g., Asp-Asp-Ala-Gly-Glu);

[264] Leader may for example be a single amino acid, an amino acid sequence, a peptide (e.g., leader peptide or signal peptide), or a protein; and Leader is selected to block the N-terminus from conjugation, assists in purification of the multi-peptide (e.g., (His)<sub>6</sub>-Ala-Asp-Gly-Glu – cleavable by enzyme cocktail: V8 protease (endoproteinase Glu-C) and endoproteinase (Asp-N)), improves solubility and/or assists in excretion from the cell, (e.g., Ala-Asp-Gly-Glu); and Leader is preferably cleavable from the multi-peptide by enzymatic or chemical cleavage;

[265] Extension may for example be a single amino acid, an amino acid sequence, a peptide (e.g., leader peptide or signal peptide), or a protein; and Extension is selected to block the C-terminus from conjugation, assist in purification of the multi-peptide (e.g., (His)<sub>6</sub>-Ala-Asp-Gly-Glu), improves solubility, and/or assists in excretion from the cell, (e.g., Ala-Asp-Gly-Glu – cleavable by enzyme cocktail: V8 protease

(endoproteinase Glu-C) and endoproteinase (Asp-N)); and Extension is preferably cleavable from the multi-peptide by enzymatic or chemical cleavage.

[266] In another example, an enzyme degradation site, preferably an enzyme degradation site that is not present in NP (e.g., Glu-Ala-Gly-Glu). The leader in this construct may again be a signal peptide for causing a cell to excrete the BNP, such as Ala-Asp-Gly-Glu. An "extension" that may be used in the construct that would assist in the purification of the multi-peptide may also be included (e.g., (His)<sub>6</sub>-Ala-Asp-Gly-Glu). An enzyme that may be used to cleave the peptide conjugate is V8 protease (endoproteinase Glu-C). The resulting product is NP-Glu.

[267] The invention also provides a pro-X-polypeptide, where X is a natriuretic peptide. The Pro-X-peptide for BNP can be designed to carry a leader peptide as the Pro moiety and which can be linked to BNP sequence via an enzymatic cleavage site. A gene sequence can be designed that encodes the expression of peptide as pro-BNP peptide in the selected recombinant technology. The pro-moiety can also be selected to aid more efficient purification from the fermentation scheme. Pro-BNP peptide can be conjugated post-expression with the oligomer and then the pro moiety can be cleaved by a selected enzyme, mobilized or immobilized, to provide the BNP conjugate which can be more easily purified via conventional chromatographic methods in high yield. Specific enzyme cleavage sites will be included between pro moiety and BNP sequence so that the pro moiety can be enzymatically cleaved to yield the BNP sequence.

#### Pro-BNP model synthesis

[268] The pro-BNP construct will be assessed with a synthetic pro-BNP model having a BNP sequence and additional specific amino acids. This synthetic model will be conjugated with oligomer and subjected to cleavage by a specific enzyme to monitor the production of BNP-Oligomer conjugate.

#### Designs of pro-BNP

[269] The leader sequence (pro-moiety) can include a small peptide with a specific enzyme cleavage sequence based on the synthetic model. Other functional amino acid sequences can also be inserted in the leader/spacer sequence to allow easy purification of the pro-BNP protein. The leader sequence can also serve as the pro-moiety to protect the N-terminus from undesired modification during conjugation and can be cleaved upon specific enzyme treatment. Other features can also be built into the leader peptide sequences to allow ease of isolation as pro-BNP or as pro-BNP oligomer conjugate. The leader peptide can also be attached to the C-terminus of the BNP sequence. The leader peptide can also be designed to allow attachment of known fusion proteins.

Constructing expression system for pro-BNP and recombinant development

Pro-BNP expression

[270] Functionally specific leader sequences will be provided at the N-terminus or/and C-terminus of BNP  
5 for insertion into the expression gene sequence or expression cassette of the selected recombinant  
technology. The expression sequence of a known fusion protein (Gaken et al, 2000) can also be inserted into  
the expression gene in one of the constructs. Using an established procedure, the successful transformation  
expressed genes in the cells can be monitored. The positive transgenic isolates or cells can be isolated and  
grown for evaluation for the expression of the designed proteins. Expressed proteins can be purified and  
10 sequenced. The purified pro-BNP constructs can then be evaluated. Selected cell lines can be characterized  
and selected for selection future use.

**9.28 Production of pro-multipetide**

Construction of pro-pentapeptide BNP-1 with Trypsin and Carboxy peptidase-B cleavage spacers and His  
tagged Leader peptide

15

The coding sequence for the full length of pro-petapeptide BNP-1 can be provided according to the  
following formula: Leader-NP-[Spacer-NP]<sub>n</sub> where:

Spacer is Arg-Arg-Asp-Ala-Glu-Asp-Pro-Arg,

Leader is Glu-Gly-Asp-Arg-Arg,

20 Extension is (His)<sub>6</sub>-Glu-Gly-Asp-Arg-Arg;

NP is hBNP.

In this embodiment, the NP can be released using a Trypsin and Carboxypeptidase B enzyme cocktail.

(a) Plasmid construction

25 Using the standard molecular biology techniques, a plasmid is constructed for expressing the amino acid  
sequence of pro-pentapeptide BNP-1 [(His)<sub>6</sub>-Glu-Gly-Asp-Arg-Arg.)-BNP- Arg-Arg-Asp-Ala-Glu-Asp-  
BNP- Arg-Arg-Asp-Ala-Glu-Asp- BNP- Arg-Arg-Asp-Ala-Glu-Asp- BNP- Arg-Arg-Asp-Ala-Glu-Asp-  
BNP] . The plasmid is Codon optimized for the host cell (e.g., E coli) used.

30 DNA fragment coding this multipetide sequence is assembled synthetically, starting from post leader  
sequence and the cleavage sites are added in the order of 3' of the His tag/5' of BNP sequence. cDNA of the  
sequence is purified from ployacrylamide gel using standard techniques. The plasmid structure is confirmed  
by restriction enzyme analysis.

(b) Expression and cell recovery

The E-coli cells expressing pro-pentapeptide BNP-1 are cultured with nutrients sufficient to produce the pro-multipetide. The (His)<sub>6</sub> tag pro-penta BNP is recovered from the cells by cell disruption followed by centrifugation, tangential filtration/untrafiltration, homogenization and solubilization of inclusion bodies.

- 5 (c) Isolation of the pro-pentapeptide BNP-1 from the solubilized inclusion via affinity chromatography  
A HiTrp chelating (Ni<sup>2+</sup>) HP column (Amersham Bioscience) is prepared and the columns are washed with  
10 column volumes of distilled water to remove the storage solution, is charged with metal ion solution  
(NiSO<sub>4</sub>, 0.1M) and washed with distilled water to remove unbound. The filtered solution after inclusion  
body solubilization, is loaded to this column and the column is washed with 10 column volume of binding  
10 buffer (20mM phosphate buffer, pH 7.4, containing 0.5M sodium chloride and 20mM imidazole). Using a  
linear gradient 10 column volumes of elution buffer (20mM sodium phosphate, pH 7.4, containing 0.5M  
Sodium chloride and 0.5M imidazole) the column is eluted and followed by another 2 column volume of  
elution buffer at 100%. This procedure purifies the (His)<sub>6</sub> tag pentapeptide from other components from the  
cell recovery sample via chelation to Ni<sup>2+</sup> affinity of the column. The purity of the pentapeptide is analyzed  
15 by RP-HPLC method to be > 30%.

(d) Purification and analysis:

- The pentapeptide is then further purified via C-18 preparative HPLC to a purity >75%. The purified  
pentapeptide is analyzed by ES/MS analysis and provided M+1 ion peaks for the expected MW of pro-  
20 pentapeptide BNP-1. Micro sequencing of the material is used to confirm the amino acid sequence of the  
multipetide.

## 9.29 Production of multiple units of Lys-3 BNP conjugate from pro-pentapeptide BNP-1

### (a) Conjugation of pentapeptide

- 25 Pro-pentapeptide BNP-1 (3.20 x 10<sup>-4</sup> mmol) is dissolved in 5 mL of DMSO. To the solution is added 45  $\mu$ L  
of triethylamine. The solution is allowed to stir for 5 minutes before a solution of activated PEG7-hexyl  
oligomer (19.6 x 10<sup>-4</sup> mmol) in ethanol is added. After the reaction has progressed such that HPLC analysis  
indicates that the pro-multipetide has been consumed (or the concentration of pro-multipetide is no longer  
decreasing), the reaction is quenched by addition of 0.5 mL of 50% aqueous acetic acid solution. The  
30 reaction mixture is then processed and exchanged into 100 mM Tris-HCl Buffer, pH 7.6. The major  
composition of this mixture is expected to be conjugated multipetide at Lys3 of each BNP unit.

### (b) Enzyme Cocktail Cleavage of Oligomer-Conjugated Pro-pentapeptide BNP-1 to conjugated BNP units

- An aliquot of the Tris-HCl solution of the product mixture from Example 2(a) is analyzed by HPLC to  
35 determine the polypeptide concentration therein. A solution of trypsin (TPCK treated; from bovine pancreas)  
is prepared in 100 mM Tris-HCl Buffer, pH 7.6. A solution of carboxypeptidase B (from porcine pancreas)  
is prepared in 100 mM Tris-HCl Buffer, pH 7.6.

The crude mixture (1 mol eq.) is then allowed to react with trypsin ( $1.39 \times 10^{-3}$  mol eq) and carboxypeptidase B ( $4.56 \times 10^{-4}$  mol eq.). After 30 minutes, the reaction is quenched by addition of 1% trifluoroacetic acid in acetonitrile. The product mixture of the reaction is processed and analyzed by HPLC. Retention time (versus that of reference standards) and mass spectral analysis are used to determine identity. The expected products of the reaction are Lys3 hexyl-PEG7-conjugated BNP, Lys14 hexyl-PEG7-oligomer-conjugated BNP, Lys27 hexyl-PEG7-oligomer-conjugated BNP, Di hexyl-PEG7- oligomer conjugated BNP, Des Arg-His BNP and Des Arg-His hexyl-PEG7-oligomer conjugated (Lys3 or Lys14 or Lys27) BNP. The major composition of this mixture is Lys3-hexyl-PEG7-conjugated BNP.

### 9.30 Purification of Pro-pentapeptide BNP-1 conjugates from crude conjugation mixture

Each major product obtained from the conjugation reaction described in Example 2(b) is isolated using reversed-phase HPLC. A column (1.0 cm. i.d. x 25 cm. length) is packed with a commercially available C18 stationary phase known to be useful for the resolution of polypeptides and proteins, and then is incorporated into an HPLC system. The system is equilibrated with elution buffer that comprises a mixture of 75% mobile phase A (H<sub>2</sub>O with 0.1% trifluoroacetic acid) and 25% mobile phase B (acetonitrile with 0.1% trifluoroacetic acid). The Tris-HCl solution of the product mixture from Example 21(a) is applied to the column, and the major products are separated and eluted using a gradient elution in which the percentage of the acetonitrile component is increased from 25%-55% over 120 minutes. Fractions are collected and analyzed by HPLC to determine the identity and purity of the product therein. Common fractions of each product are pooled, and the solvent is removed by rotary evaporation. The identity and purity of each product peak are determined by HPLC and mass spectrometry. The expected products consist of 3 multi-peptide monoconjugates (conjugated at either Lys3 or Lys 14 or Lys 27 of each unit of BNP), 3 multi-peptide diconjugate (conjugated at Lys3&Lys14 or Lys14& Lys27 or Lys27&Lys3), 1 multi-peptide triconjugate (conjugated at Lys3, Lys14 and Lys 27) and 1 multi-peptide tetraconjugate (conjugated at N-terminal of leader peptide, Lys3, Lys14 and Lys 27)

### 9.31 Preparation of Lys3-Hexyl-PEG7-oligomer conjugated BNP from Enzyme Cocktail Cleavage of Isolated Conjugate of pro-pentapeptide BNP-1

The conjugate, monoconjugated Lys3-hexyl-PEG7-oligomer pro-pentapeptide BNP-1, that is obtained using the procedure described in Example 3 is dissolved in 100 mM Tris-HCl Buffer, pH 7.6, and the resulting solution is analyzed by HPLC to determine the polypeptide concentration therein. A solution of trypsin (TPCK treated; from bovine pancreas) is prepared in 100 mM Tris-HCl Buffer, pH 7.6. A solution of carboxypeptidase B (from porcine pancreas) is prepared in 100 mM Tris-HCl Buffer, pH 7.6. The crude mixture (1 mol eq.) is then allowed to react with trypsin ( $1.39 \times 10^{-3}$  mol eq.) and carboxypeptidase B ( $4.56 \times 10^{-4}$  mol eq.). After 30 minutes, the reaction is quenched by addition of 1% trifluoroacetic acid in acetonitrile. The products are processed and analyzed by HPLC. Retention time (compared to that of

reference standards) and mass spectral analysis are used to determine identity. The expected products of the reaction are respective of each conjugates used. For example, Monoconjugated Lys3- hexyl-PEG7-oligomer-conjugated pro-pentapeptide BNP-1 is to provide Lys3 -hexyl-PEG7-oligomer-conjugated BNP and Des Arg-His Lys3-hexyl-PEG7-oligomer-conjugated BNP.
